

# STUDY AREA SCREENING EVALUATION ADDENDUM

for

# SITE 19 – ON-SHORE DERECKTOR SHIPYARD

NAVSTA, Newport, Rhode Island

# Naval Facilities Engineering Command Mid-Atlantic

Contract Number N62470-08D-1001 Contract Task Order WE20

January 2013

# STUDY AREA SCREENING EVALUATION ADDENDUM FOR

SITE 19 - ON-SHORE DERECKTOR SHIPYARD

NAVSTA, NEWPORT, RHODE ISLAND

COMPREHENSIVE LONG-TERM ENVIRONMENTAL ACTION NAVY (CLEAN) CONTRACT

Submitted to:
Naval Facilities Engineering Command Mid-Atlantic
9742 Maryland Avenue
Norfolk, Virginia 23511-3095

Submitted by:
Tetra Tech
234 Mall Boulevard, Suite 260
King of Prussia, Pennsylvania 19406-1433

CONTRACT NUMBER N62470-08D-1001 CONTRACT TASK ORDER WE20

**JANUARY 2013** 

PREPARED UNDER THE DIRECTION OF:

THOMAS A. CAMPBELL PROJECT MANAGER

TETRA TECH

**WILMINGTON, MASSACHUSETTS** 

Thoma A. Complet

APPROVED FOR SUBMISSION BY:

JOHN J. TREPANOWSKI, P.E.

PROGRAM MANAGER

**TETRA TECH** 

KING OF PRUSSIA, PENNSYLVANIA

SECTI	<u>ON</u>		<u>PAGE</u>
	EXECUT	TIVE SUMMARY	ES-1
1.0	INTROD	UCTION	1-1
	1.1	SITE LOCATION	1-1
	1.2	PROJECT OBJECTIVES	
	1.3	SASE ADDENDUM REPORT ORGANIZATION	1-2
2.0	PREVIO	US SITE ACTIVITIES	2-1
	2.1	1997 SASE INVESTIGATION	
	2.2	REMOVAL ACTIVITIES	2-3
3.0	FIELD IN	NVESTIGATION	
	3.1	SOIL INVESTIGATIONS	3-1
	3.1.1	Overview of Soil Borings	3-1
	3.1.2	Field Measurements and Observations during Advancement of Soil Borings	
	3.2	GROUNDWATER SAMPLING	3-9
	3.2.1	Monitoring Well Installation	3-10
	3.2.2	Groundwater Monitoring Well Development and Water Level Measurements	3-10
	3.2.3	Groundwater Sample Collection	
	3.3	SOIL-GAS SAMPLE COLLECTION	3-12
4.0		TICAL RESULTS	
	4.1	SAMPLE ANALYSIS AND DATA VALIDATION	
	4.2	SUMMARY OF ANALYTICAL RESULTS	
	4.2.1	Southern Waterfront Area	
	4.2.2	Building 234 Area	4-3
	4.2.3	Central Shipyard - Building 42 ("Hotspot" Excavation Area and Downgradient of Sump S42-1)	4-4
	4.2.4	PCB Removal Area - Building 6/Test Pit 14/Area	
	4.2.5	PCB Removal Area - Building 6/Test Pit 14/Area (Transformer Bank)	
	4.2.6	Northern Waterfront - Huts 1 and 2	
	4.2.7	Northern Waterfront	
5.0	HUMAN	HEALTH RISK ASSESSMENT	5-1
	5.1	DATA EVALUATION	5-2
	5.1.1	Data Usability	5-2
	5.1.2	Selection of Chemicals of Potential Concern	
	5.1.3	COPCs Selected for the HHRA	
	5.2	EXPOSURE ASSESSMENT	5-22
	5.2.1	Conceptual Site Model	
	5.2.2	Exposure Point Concentrations	5-25
	5.2.3	Chemical Intake Estimation	5-27

# **EXECUTIVE SUMMARY**

This Study Area Screening Evaluation (SASE) Addendum was prepared by Tetra Tech, Inc., (Tetra Tech) for the U.S. Department of Navy (Navy) to document onshore field work conducted as part of additional sampling activities for Site 19, On-Shore Derecktor Shipyard (the Site) at Naval Station (NAVSTA) Newport, Rhode Island. This report is an addendum to the *On-Shore Site Assessment Screening Evaluation, Former Derecktor Shipyard, Naval Education & Training Center, Newport, Rhode Island* (Brown and Root Environmental [B&RE], 1997). The objectives of this SASE Addendum are to obtain analytical data where data gaps were identified by the Navy and regulatory agencies. Analytical data were used to revise the 1997 SASE human health risk assessment (HHRA) and to provide a recommendation on a path forward for the Site.

The Site consists of undeveloped areas, foundations of former buildings, temporary offices, parking areas, storage areas utilized by the U.S. Coast Guard (USCG) for buoy maintenance, and on-going construction projects (USCG Buoy Tender Waterfront). The 1997 SASE divided the Site into five subareas; the Northern Waterfront, the Central Shipyard, the polychlorinated biphenyl (PCB) removal area, the Building 234 Area, and the Southern Waterfront.

The Site was utilized by the Navy for shipbuilding activities from 1962 to 1978, and subsequently by a privately operated ship maintenance and construction facility from 1979 to 1992. A Preliminary Assessment (PA) was conducted in May 1993 that identified several areas of concern where additional investigations were recommended. In 1997 a SASE was completed which included soil and groundwater sampling activities. The SASE summarized analytical data and calculated risk to human health through the completion of a baseline HHRA. Recommendations included excavation of "hot spots" and filling of sumps and trenches. Various removal actions were conducted from 1997 to 2007 to address the recommendations contained in the SASE Report.

Analytical results of the 2011 soil, groundwater, and soil gas samples collected from the five areas of the Site are summarized as follows. Soil samples in the Southern Waterfront contained six metals above U.S. Environmental Protection Agency (USEPA) Regional Screening Levels (RSLs). Volatile organic compounds (VOCs) were detected in groundwater with trichloroethene (TCE) exceeding the USEPA maximum contaminant level (MCL) in five Northern Waterfront wells. In the Central Shipyard, arsenic in groundwater was detected above the MCL. Soil samples collected in the PCB removal area documented PCB, polynuclear aromatic hydrocarbons (PAHs), and metals above RSLs. Soil samples collected in the Northern Waterfront detected PAHs and metals above RSLs and soil gas samples detected five VOCs above USEPA soil gas criteria.

The SASE HHRA was revised using historical soil data and current soil, groundwater and soil gas data. Arsenic was the major contributor to the hazard index (HI) for hypothetical child residents exposed to subsurface soil at the PCB removal area. TCE was the major contributor to the HI for hypothetical child and adult residents exposed to groundwater at the North Waterfront. Manganese was the major contributor to the HI for future industrial workers exposed to groundwater at the Central Shipyard. Arsenic, cobalt, iron, and manganese were the major contributor to the HI for hypothetical child and adult residents exposed to groundwater at the Central Shipyard. Manganese was the major contributor to the HI for hypothetical child residents exposed to groundwater at former Building 234.

Cancer risks exceeding USEPA cancer risk range (10<sup>-4</sup> to 10<sup>-6</sup>) was determined for hypothetical residents in one area for groundwater and in two areas for soil. In addition, cancer risks exceeding the RIDEM cancer risk threshold of 10<sup>-5</sup> was determined for hypothetical receptors in each area and for current industrial workers in two areas and future industrial workers in three areas, and future trespassers in the PCB Removal Area.

The following table summarizes carcinogenic risks that exceed the USEPA cancer target risk range.

Area	Medium	Receptor	Contaminant Contributing to Cancer Risk
Central Shipyard	Groundwater	Future Industrial Workers (2E-04) Hypothetical Child Residents (6E-04) Hypothetical Adult Residents (1E-03) Hypothetical Lifelong Residents (2E-03)	Arsenic
Building 234	Surface Soil	Hypothetical Child Residents (3E-04) Hypothetical Lifelong Residents (4E-04)	PAHs, arsenic, chromium
PCB Removal Area	Surface Soil	Hypothetical Child Residents (5E-04) Hypothetical Lifelong Residents (5E-04)	PAHs, arsenic
	Subsurface Soil	Hypothetical Lifelong Residents (2E- 04)	PAHs, arsenic, chromium

The On-Shore Derecktor Site is currently located on an active portion of NAVSTA Newport. Several construction projects are being conducted at the site to improve the site for future Navy and USCG use. Future land use will not include residential use due to the industrial nature of the site and on-going Navy infrastructure constructions plans.

Executive Summary Addendum 1 FINAL

The conclusions of the risk assessment determined that risk under the residential use scenario is present for soil and groundwater. Risk under the future industrial user scenario is present due to inadvertent ingestion of groundwater containing arsenic and manganese. Several removal actions have been conducted at the site to remove sources of contamination present from previous site uses.

This SASE Addendum fulfills the role of a Remedial Investigation for this site because this report, coupled with the previous SASE report, contains the risk assessment component required by CERCLA. Based on the risks estimated for the residential and industrial workers scenarios, it is recommended that the Site be carried forward to a Feasibility Study (FS) step which will evaluate remedial alternatives for soil and groundwater.

### 1.0 INTRODUCTION

This Study Area Screening Evaluation (SASE) Addendum was prepared by Tetra Tech, Inc., (Tetra Tech) for the U.S. Department of Navy (Navy) to document onshore field work conducted as part of additional sampling activities for Site 19, On-Shore Derecktor Shipyard (the Site) at Naval Station (NAVSTA) Newport, Rhode Island. This addendum is a supplement to the *On-Shore Site Assessment Screening Evaluation, Former Derecktor Shipyard, Naval Education & Training Center, Newport, Rhode Island* (B&RE, 1997). Tetra Tech is conducting this work at the request of the Navy under Comprehensive Long-Term Environmental Action Navy (CLEAN) Contract No. N62470-08-D-1001, Contract Task Order (CTO) WE20.

The Site was utilized by the Navy for shipbuilding activities from 1962 to 1978, and subsequently by a privately operated ship maintenance and construction facility from 1979 to 1992. In May 1993 a Preliminary Assessment (PA) was conducted by Halliburton NUS Corporation and ENSR Consultants and Engineers. The PA identified several areas of concern, identified by visual observations and a review of historical records for the Site, where additional investigations were recommended. Soil and groundwater sampling activities were conducted throughout the Site as part of the SASE completed in 1997. The SASE summarized analytical data and calculated risk to human health through the completion of a baseline human health risk assessment (HHRA). Recommendations generated from the SASE included excavation of "hot spots" and filling of existing sumps and trenches. Various removal actions were conducted from 1997 to 2007 to address the recommendations contained in the SASE Report.

# 1.1 SITE LOCATION

The On-Shore Derecktor Shipyard is located at NAVSTA Newport, adjacent to the eastern portion of Coddington Cove, Narragansett Bay, as illustrated in Figure 1-1. The Site consists of undeveloped areas, relic foundations of former buildings, temporary offices, parking areas, storage areas utilized by the U.S. Coast Guard (USCG) for buoy maintenance, and on-going construction projects (USCG Buoy Tender Waterfront) as depicted in Figure 1-2. Additional site information regarding the operational history of activities at the Site can be found in the 1997 SASE Report (Brown & Root Environmental [B&RE] 1997).

Section 1 Addendum 1 FINAL

#### 1.2 PROJECT OBJECTIVES

The project objectives of the SASE Addendum are to collect additional samples and obtain analytical data from areas where data gaps were identified by the Navy, the U.S. Environmental Protection Agency (USEPA) and the Rhode Island Department of Environmental Management (RIDEM). This data and historical site data will be used to revise the 1997 baseline HHRA and to provide recommendations for any additional work for the Site.

Additional groundwater and soil analytical data was generated from five areas of the Site which included the following:

- Southern Waterfront
- Building 234 Area
- Central Shipyard (Building 42)
- Polychlorinated biphenyl (PCB) Removal Area (Building 6/Test Pit 14 Area and Transformer Bank)
- Northern Waterfront (includes the Huts 1 and 2 Area)

The baseline HHRA was revised to incorporate changes in the risk assessment methodology since the original HHRA was prepared according to current Navy and USEPA risk assessment guidance documents. In addition, the vapor intrusion pathway is evaluated, through the collection of soil gas samples from the Northern Waterfront.

#### 1.3 SASE ADDENDUM REPORT ORGANIZATION

This SASE Addendum serves to supplement the 1997 SASE Report and, as such, the reader is referred to the 1997 SASE Report for detailed information on the background and operational history of the site, previous investigations (e.g. PA), geology and hydrogeology, and fate and transport of contaminants.

This SASE Addendum is organized into six sections, with tables and figures presented following the document text:

- Section 1.0 of the report outlines the project objectives and the organization of the SASE Addendum Report.
- Section 2.0 provides a discussion of the 1997 SASE findings along with an overview of the removal activities previously conducted at the Site.

- Section 3.0 presents an overview of the field investigations conducted as part of this SASE
   Addendum designed to assess existing data gaps in environmental media quality at the Site.
- Section 4.0 presents an assessment of environmental media impacts from contamination identified at the Site.
- Section 5.0 presents the results of the baseline HHRA.
- Section 6.0 provides the summary and conclusions from investigation efforts conducted under this SASE Addendum.

#### 2.0 PREVIOUS SITE ACTIVITES

This section presents a summary of previous environmental investigations conducted at the Site.

#### 2.1 1997 SASE INVESTIGATION

The SASE investigation was conducted to determine the presence of contaminants in the soils and groundwater in the areas of concern previously identified by the Derecktor Shipyard PA (Halliburton NUS, 1993). As part of this investigation, 28 test pits were excavated and 25 soil borings were advanced, eight of which were completed as permanent groundwater monitoring wells. Soils were evaluated using field-screening instruments and visual observations, and samples of suspect soils were delivered to an analytical laboratory for chemical analysis and reporting. In addition, eight groundwater samples were collected and submitted for laboratory analysis and reporting.

#### Findings of the SASE Investigation

Soil sample analysis confirmed the conclusions of the PA that surficial discharge of various contaminants had occurred at several locations across the Site. Much of the contamination in site soils was localized and apparently related to surficial releases. Low concentrations of contaminants were also detected in groundwater samples collected at the Site. The SASE findings are summarized below:

- Elevated concentrations of phenolic compounds and polynuclear aromatic hydrocarbon (PAH) compounds were detected in soil samples from test pit (TP) 16 and TP17 in the area around two structures (Huts 1 and 2). The evaluation of data determined that the contaminants were likely associated with the former vehicle maintenance operations that were performed in this location.
- Elevated concentrations of PCBs, PAHs, and metals were found in soils from unpaved areas northeast of Building 6 (TP14), which received surface runoff from an adjacent railroad right-of-way, a former electrical transformer pad, and the paved areas east of Building 6 where transformers had reportedly been stored. In addition, the former "pipe shop" was located in the northeast corner of Building 6 and it was suspected that wastes generated from related operations were discharged to soils in this area.
- Slightly elevated concentrations of PAHs and metals were found in soils from the former location of a bilge water disposal area north of Building 42 (monitoring well [MW]05).
- Slightly elevated concentrations of pesticides and leachable metals were detected in soils from the area south of Building 42 (MW07 and TP11), which was a former bulk material storage area.
- Elevated concentrations of phthalate compounds were detected in the soils south of Building 234 (TP07 and TP08), which was an area of suspected chemical discharge described in the PA report.

Section 2 Addendum 1 FINAL

- High concentrations of semi-volatile organic compounds (SVOCs) and butyltin compounds were detected in the soils under Building 42, apparently due to past discharges from sumps within the building.
- Petroleum-related contaminants were found in soils from the former parking area, east (upgradient) of Huts 1 and 2; however, the contamination appeared to be the result of upgradient releases from former underground storage tanks (USTs) at Building 62. This area was investigated as part of a separate study.
- Low concentrations of petroleum fuel components were detected in the shallow soils north of Building
   234. Components were believed to be residual contaminants from former USTs in this area.

# Findings of the Risk Evaluation Assessment

A HHRA was performed in 1997 to identify risks to potential receptors at the Site. The current potential receptors evaluated were limited to persons working at the Site on a full-time basis, as well as potential trespassers on the Site. Future receptors evaluated included industrial workers, excavation workers, trespassers, and residents. The primary contributors to calculated risk were arsenic (all areas) and PCBs (from surface soils north of Building 6).

Arsenic is a naturally occurring element in soil and groundwater in Rhode Island, related to the character/mineralogy of the geologic units in the area. A risk-based acceptable (target) level for arsenic in soils has been set by RIDEM, for industrial properties. Many samples of soil at and upgradient of this and other Sites on Aquidneck Island have been found to exceed this target level.

PCBs were found at elevated concentrations in soils north of Building 6. Industrial workers in this area may be exposed to these surface soils, which could cause an increased risk of cancer above the USEPA recommended target level of one in one-hundred thousand for incremental cancer risk.

# Recommendations of the Site Assessment Screening Evaluation Report

Recommendations of the SASE included performing limited soil excavations at several areas found to have elevated concentrations of chemical contaminants. These areas were located to the northeast of Building 6, where the risk evaluation showed an increased risk from PCBs present in the soil and the soils under Building 42 which were found to be contaminated with paint residues. Finally, some of the drainage systems under the Building 234 foundation and south of Building 42 were recommended for dismantling or repair, depending on the plans for future use of these specific areas.

#### 2.2 REMOVAL ACTIVITIES

In August 1995, NAVSTA Newport contracted with OHM Corporation (OHM) to conduct a removal action to excavate and dispose of sandblast grit that was known to be present on the ground to the north and east of Building 42. OHM removed this material and covered the exposed ground with a sand and crushed stone mix. As part of this effort, the embankment to the east of Building 42 was excavated and repaired.

Various removal actions were conducted by Foster Wheeler Environmental Corporation (subsequently known as Tetra Tech EC, Inc.) from 1997 through 2007. These actions included the following:

- Southern Waterfront Berm Removal. A berm containing construction debris and soil located in the southern waterfront area was removed. Prior to removal, the berm was divided into six equal sections, which were described as Sections 1 through 6. Soils from each section were removed and stockpiled for composite sampling prior to disposal. Samples were analyzed for volatile organic compounds (VOCs), SVOCs, PCBs, metals, and total petroleum hydrocarbons (TPH). Exceedances of RIDEM direct exposure criteria were noted for SVOCs and arsenic. Under an agreement between Navy and RIDEM, stockpiles containing arsenic concentrations above 12 parts per million (ppm) and lead above 150 ppm were disposed off-site. Shoreline restoration activities were conducted after the removals.
- Building 42 S42-1 Sump Pit Removal. Surficial soils associated with Sump 1, located beneath former Building 42, were removed to a depth of one foot below ground surface (bgs). Confirmatory samples for VOCs, SVOCs, PCBs, pesticides, metals, and TPH laboratory analyses and reporting were collected following the excavation. Analytical results detected concentrations of arsenic from 15 ppm to 22 ppm which exceeded RIDEM direct exposure criteria (DEC).
- Test Pit 14 PCB Contaminated Soil Removal. A series of excavations and confirmatory sampling was conducted to delineate and remove PCB-contaminated soils. Confirmation samples detected the presence of PCBs, lead, arsenic, and TPH above RIDEM DECs. Approximately 430 tons of PCB-contaminated soil was removed from the Test Pit 14 area.
- Building 42 S42-5 Sump Investigation and Removal. A concrete sump and associated valve chamber were removed. Approximately 42 tons of concrete debris and associated piping were disposed. At the completion of removal activities, confirmation samples for VOCs, SVOCs, PCBs, metals, and TPH were collected for laboratory analysis and reporting. One location had SVOC and arsenic exceedances of RIDEM DEC.
- Exploratory Trenching, Former Disposal Pits. Three exploratory trenches were excavated north of former Building 42 (i.e. bilge water disposal area). Based on sample analysis of the soil excavated from the trenches, a hotspot removal was conducted at one location. The hotspot removal action included the removal and disposal of approximately 25 cubic yards of soil.

Section 2 Addendum 1 FINAL

• Sandblast Grit Removal. A series of removal actions were conducted north of Building 6 in the vicinity of a new watchtower to remove subsurface sand blast grit.

## 3.0 FIELD INVESTIGATIONS

This section describes the field investigation activities implemented as part of the SASE Addendum for the Site. Field tasks, implemented in accordance with the Work Plan Addendum (Tetra Tech, 2011), were conducted by Tetra Tech personnel in February and March of 2011. This section is supported by a series of appendices including:

<u>Appendix A</u> – Field Documentation Forms

Appendix B – Soil Boring and Monitoring Well Construction Logs

Appendix C - Field Modification Records

Appendix D - USEPA low flow standard operation procedures (SOPs)

Appendix E – 2011 Analytical Data Results

Field investigation activities conducted at the Site are summarized in Sections 3.1 through 3.3. The overview of the investigation activities presented below includes; number of samples, locations of samples, types of laboratory analyses, rationale for each location, and field observations and measurements. Samples were collected and analyzed in accordance with the quality assurance/quality control (QA/QC) criteria defined in the Work Plan Addendum (Tetra Tech, 2011).

#### 3.1 SOIL INVESTIGATIONS

Soil samples were collected at the Site to evaluate different target areas and different potential sources of contaminants. This field effort included the advancement of soil borings at several target areas at the Site, as illustrated in Figure 3-1.

Drilling activities were conducted at the Site in order to characterize the overburden geology, to collect surface and subsurface soil samples for laboratory analysis, and for the installation of permanent groundwater monitoring wells. The following subsections provide an overview of the soil boring investigation and summary of the field measurements and observations made during soil boring advancement activities.

### 3.1.1 <u>Overview of Soil Borings</u>

A total of 17 soil borings were advanced at the Site for the purpose of characterizing soils, and an additional nine soil borings were advanced for the purpose of installing permanent groundwater monitoring wells. The soil boring and permanent monitoring well locations are shown on Figure 3-1.

Boring logs from this effort describing localized soils are presented in Appendix B. A soil boring sample summary is presented on Table 3-1 and a summary of borings and the rationale for each location is provided on Table 3-2.

Soil borings were advanced using direct push technology (DPT), hollow stem auger (HSA) drilling techniques, or hand augers. The soil borings were advanced in accordance with the procedures specified in the approved Work Plan Addendum, except for the following field modifications as documented in field modification records presented in Appendix C.

- Overburden groundwater was not encountered in the original upgradient location of MW223 located in the Naval Underwater Systems Center (NUSC) Fleet Parking area. The bedrock aquifer is considered to be interconnected with the overburden aquifer in the Northern Waterfront; therefore, MW223 was screened in bedrock.
- Monitoring well locations MW221 and MW222 were shifted to the west away from the unnamed road due to traffic safety concerns.
- Monitoring well location MW220 was relocated due to on-going waterfront construction to the south away from the construction zone.
- Soil boring SB218 was renamed SB224 to remove any potential confusion with monitoring well MW218.
- MW11 was a historical permanent monitoring well that was advanced using HSA drilling techniques. During the most recent field event, the monitoring well could not be located and it was determined to be either destroyed or inaccessible. A temporary well point (MW11A) was installed using DPT to collect groundwater and soil gas samples from that location. The original monitoring well (MW11) was screened from 19 to 29 feet (ft.) bgs. The replacement well screen length was adjusted to 5 to 10 ft. bgs due to 1) reaching refusal at shallower depths using the DPT rig, and 2) the need to collect soil gas samples above the water table after a recent heavy rain event.
- Monitoring well location MW219 was shifted to the south away from an armory, utilities, and a septic tank located at the U.S. Marine Corps (USMC) temporary offices.
- Soil gas sample identifiers were renamed to correspond with the co-located monitoring well identifications.
- Existing monitoring well MW02 could not be located. A new monitoring well (MW02A) was installed in the surveyed location of the original well. MW02A was screened at the same depth interval as the original monitoring well.
- In order to conduct a more comprehensive evaluation of the Building 234 sump, the investigation procedure was updated. Instead of advancing a single soil boring (SB203) as prescribed in the Work Plan Addendum, two exploratory borings were advanced with hand augers followed by the

W5211766F 3-2 CTO WE20

advancement of three additional DPT exploratory borings. This approach provided a more comprehensive coverage and helped to determine if a concrete bottom was present along the entire length of the sump. For the purposes of site boring counts, this location will be considered SB203.

Of the 26 total borings, 13 were advanced using HSA drilling techniques, 9 were advanced using DPT, and 4 were advanced using hand augers. DPT drilling was conducted with a hydraulically-powered direct-push GeoProbe<sup>TM</sup> drilling rig. Surface and subsurface soil samples were collected using 2-inch diameter Macrocore® samplers with acetate liners. Soil borings were advanced in five foot intervals to the top of bedrock or refusal. HSA drilling was conducted by using a conventional drill rig to advance through subsurface material using a 4.25-inch insider diameter (ID) HSA, and a 2-foot long, 2-inch outside diameter (OD) split-barrel sampler. The split barrel sampler was advanced in 2-foot intervals. Continuous soil samples were collected at select locations, during boring advancement. Hand drilling was conducted by hand turning a stainless steel auger handle until the desired depth was reached. When the target depth was reached the auger was extracted from the borehole and the soil boring was retrieved in roughly 1 ft. intervals.

Once the soil boring was retrieved from the ground the field geologist screened the soil for total VOCs using a photoionization detector (PID). The headspace soil aliquot was collected and the soil description and other observations were recorded on the boring log.

Up to three sample aliquots were collected from each split spoon/sleeve/auger barrel. One aliquot was used for jar headspace screening for total organic vapors, a second aliquot was collected for potential laboratory VOC and/or gasoline range organics (GRO) analysis, and the third aliquot was stored for other possible laboratory analysis.

The physical characteristics of each soil sample were described using the Unified Soil Classification System (USCS) and recorded on boring logs, as displayed in Appendix B. In addition to sample characteristics, other pertinent observations such as depth to water, sample moisture, depth changes in lithology, fill material, staining, and visual contaminants or odors were recorded on the boring logs.

Soil samples were analyzed for a subset of the following analyses dependent on the sample location and the criteria presented in the Work Plan Addendum: VOCs, PAHs, PCBs, metals, and GRO/diesel range organics (DRO). A summary of soil samples collected and selected for laboratory analysis is presented in Table 3-1. General observations such as sample type and number, sampling time, depth interval, and methods are also presented in Table 3-1. Analytical results are discussed in Section 4 of this report.

# 3.1.2 Field Measurements and Observations during Advancement of Soil Borings

This subsection presents a summary and description of the soil boring program completed by Tetra Tech at the five subareas of the Site. Field documentation collected during implementation of this program is provided in Appendix A (field documentation forms) and Appendix B (soil boring and monitoring well construction logs).

### Southern Waterfront Area

Two soil borings, advanced using the HSA drilling technique, were completed in the northern portion of the Southern Waterfront Area, immediately south of former Building 234. Both soil borings (B201 and B202) at this location were advanced to a terminal depth of 18 ft. bgs. One soil sample was collected from each soil boring for laboratory analysis and reporting at the interval below the topsoil layer in order to investigate if any potential PAH or metals contamination is present in the former berm Section 6 of the Southern Waterfront area.

**Boring 201:** Subsurface soil at B201 included sandy silt with gravel (0 to 2 ft. bgs), poorly graded gravel with silt (2 to 4 ft. bgs), silty gravel (4 to 11.6 ft. bgs), silty sand (11.6 to 13 ft. bgs), poorly graded sand with silt and gravel (13 to 14 ft. bgs), and silty gravel with sand (14 to 18 ft. bgs). Jar headspace screening readings were minimal, peaking at 0.6 ppm on the PID at the 2 to 4 ft. bgs interval at B201. A soil sample for laboratory analysis and reporting was collected from the 2 to 4 ft. depth interval.

**Boring 202**: Subsurface soil at B202 included sandy silt with gravel (0 to 10.4 ft. bgs), organic silt (10.4 to 12.3 ft. bgs), and sandy silt with gravel (12.3 to 18 ft. bgs). Although headspace readings were not recorded, due to instrument malfunction, the 2 to 4 ft. bgs was selected for laboratory analyses because this interval was grey in color, indicating the presence of native material below the topsoil layer.

# **Building 234 (Sump 234-4)**

At location SB203, two exploratory soil borings were advanced with hand augers followed by the advancement of three additional DPT exploratory borings. These five borings were advanced along the entire length of Sump 234-4 to determine if a concrete bottom was present and to investigate for potential historic TPH contamination associated with the operations in former Building 234. Borings were advanced to a depth of 3 to 5 ft. bgs. Inspection of the boring confid the presence of a concrete bottom in Sump 234-4 therefore no soil samples were collected. Historic records and these field observations

confirmed that the sumps were filled in with clean fill and/or sand. Photographic evidence of material obtained from the DPT borings documented the presence of fill material in Sump 234-4.

#### Central Shipyard - Building 42 ("hotspot" excavation area and downgradient of sump S42-1)

Two soil borings utilizing the HSA drilling technique were advanced in the Central Shipyard area of the Site to evaluate groundwater quality for potential shallow groundwater contamination associated with two former source areas at this location. Each soil boring at this location was advanced to a terminal depth of 20 ft. bgs. No soil samples were collected from these locations due to the presence of historic soil samples, in accordance with the Work Plan Addendum.

One soil boring (MW218) was advanced north of former Building 42, in the vicinity of TP-25, excavated in 1996 as part of the SASE field investigation. The soil boring was completed as an overburden monitoring well to investigate any potential contamination in the overburden groundwater downgradient of a suspected disposal pit area.

The second soil boring (MW219) was advanced west of former Building 42 and downgradient of former sump S42-1. This soil boring was completed as an overburden monitoring well to investigate any potential contamination in the shallow overburden groundwater from sump discharges from a paint room in former Building 42.

**MW218:** Subsurface soil at this soil boring location included a thin layer of poorly graded sand with silt and gravel (0 to 0.5 ft. bgs), sandy silt (0.5 to 9.25 ft. bgs), silt with gravelly sand (10 to 11.5 ft. bgs), weathered phyllite (12 to 13.4 ft. bgs), silty gravel (14 to 15.6 ft. bgs), poorly graded sand with silt and gravel (16 to 17.6 ft. bgs) and poorly graded gravel with silt and sand (18 to 19.4 ft. bgs). Jar headspace screening at this soil boring ranged from 0.5 to 1.4 ppm on the PID. This soil boring was completed as monitoring well MW218, screened from 10 to 20 ft. bgs in the overburden to target the interval intersecting the water table.

**MW219:** Subsurface soil at this soil boring location included a top layer of sandy silt with gravel (0 to 1.8 ft. bgs), poorly graded gravel with silt and sand (2 to 3 ft. bgs), sandy silt (4 to 7.6 ft. bgs), gravelly silt with sand (8 to 9.5 ft. bgs), silty gravel (14 to 16.2 ft. bgs), and gravelly silt with sand (18 to 19.2 ft. bgs). The maximum jar headspace reading was 1.9 ppm on the PID. This soil boring was completed as monitoring well MW219, screened from 10 to 20 ft. bgs in the overburden to target the interval intersecting the water table.

# PCB Removal Area - Building 6/Test Pit 14 Area

Seven soil borings (SB208 through SB214) were advanced at this Site subarea using DPT drilling techniques. The seven soil borings were advanced north and east of Building 6 to confirm that previous soil excavations removed PCB-contaminated soils. Due to heavy rain, headspace readings were not recorded during soil boring advancement efforts. Soil borings ranged in total depth from 0.5 to 4 ft. bgs. The soil samples collected from this location were submitted for laboratory analysis and reporting of PAH, PCB, metals, and DRO/GRO.

### PCB Removal Area - Building 6/Test Pit 14 Area (Transformer Bank)

Four soil borings (SB215, SB216, SB217, and SB224) were advanced in this area north of Building 6 at the former transformer bank using the hand auger drilling technique. These borings were completed to investigate for potential PCB contamination in the shallow soil (0 - 0.5 ft. bgs) at this area of the Site. The soil samples collected from this location were submitted for PCB laboratory analysis and reporting.

#### Northern Waterfront - Huts 1 and 2

Four borings were completed in the Northern Waterfront area in the vicinity of former Huts 1 and 2, the location of the former vehicle maintenance area. One soil boring north of former Huts 1 and 2 was advanced using a HSA drill rig to investigate for potential soil and groundwater contamination in the vicinity test pits TP-16 and TP-27, excavated in 1996 as part of the SASE investigation. The soil samples collected from this location were submitted for VOC, PAH, metals, and DRO/GRO analysis and groundwater was submitted for VOC, PAH, and metals analyses.

**MW204:** Subsurface soil at this soil boring location included a thin asphalt layer (0 to 0.2 ft. bgs), sand and gravel (2 to 16 ft. bgs), and silt, sand, and gravel (16-18 ft. bgs). Jar headspace PID screening readings peaked at 0.5 ppm. The 0 to 2 ft. bgs and 8 to 10 ft. bgs depth intervals were selected for laboratory analysis and reporting. The 8 to 10 ft. depth interval was chosen because this was the interval directly above the water table. MW204 was screened from 8 to 18 ft. bgs in the overburden to best target the interval intersecting the water table.

Three additional soil borings were advanced north/northeast of former Huts 1 and 2 utilizing the HSA drilling technique. These soil borings were advanced to investigate potential soil contamination in the vicinity of TP-16 (1996 sample location). The soil samples collected from these locations were submitted for VOC, PAH, metals, and DRO/GRO laboratory analysis and reporting.

**Boring 205:** Subsurface soil at this location included silty sand and gravel (0 to 2 ft. bgs), well graded sand and gravel (2 to 4 ft. bgs), poorly graded sand (4 to 8.5 ft. bgs), and silt with sand

and gravel (10 to 14 ft. bgs). Jar headspace PID screening readings peaked at 0.3 ppm. The depth intervals selected for laboratory analysis were from 0 to 2 ft. bgs and 8 to 8.5 ft. bgs. The 8 to 10 ft. interval was chosen because it was inferred to be directly above the water table and consisted of a poorly graded sandy material which would potentially exhibit impacts to environmental media quality from activities associated with the former vehicle maintenance area.

**Boring 206:** Subsurface material at this boring location included a thin asphalt layer (0 to 0.33 ft. bgs), a thin layer of gravel underneath (0.33 to 0.5 ft. bgs), well graded sand with silt (0.5 to 6 ft. bgs), poorly graded sand with gravel (6 to 12 ft. bgs), poorly graded sand with silt and gravel (12 to 13.5 ft. bgs), and silty sand and gravel (13.5 to 14 ft. bgs). All jar headspace PID screening readings were below 1 ppm. The intervals selected for laboratory analysis were from 0 to 2 ft. bgs and 8 to 10 ft. bgs.

**Boring 207:** Subsurface soil at this boring location included a thin silty sand and gravel layer (0 to 1.8 ft. bgs), fine sand with trace silt (22 to 4 ft. bgs), well graded sand (4 to 10 ft. bgs), well graded sand with gravel (10-12 ft. bgs) and sandy gravel (12 to 13.8 ft. bgs). All PID jar headspace screening readings were below 1 ppm. Sample for laboratory analysis and reporting were selected from the 0 to 2 ft. bgs and 10 to 12 ft. bgs intervals.

#### **Northern Waterfront Area**

Six monitoring wells were installed in the Northern Waterfront Area to provide additional groundwater data in areas where VOCs were previously detected in overburden groundwater. Four monitoring wells were located in new portions of the Northern Waterfront area and in one upgradient/background location. Two borings were advanced to replace historic wells MW02 and MW11 that could not be located. In addition, four gas probes were co-located with monitoring wells MW02A, MW03, MW11A, and MW12 for the purposes of collecting samples to evaluate soil gas quality in this area. Groundwater and soil gas samples were submitted for VOC analysis and reporting.

Monitoring wells MW220 and MW221 were installed using the HSA drilling technique downgradient of the former hazardous waste storage area.

**MW220:** Subsurface soil encountered at this location included gravelly silt with sand (0 to 2 ft. bgs), well graded sand with gravel (2 to 4 ft. bgs), poorly graded sand (4 to 10 ft. bgs), poorly graded sand with gravel (10 to 14 ft. bgs), well graded sand with gravel (14 to 17.6 ft. bgs), silt (17.6 to 18.6 ft. bgs), and poorly graded sand (18.6 to 20 ft. bgs). All jar headspace PID

W5211766F 3-7 CTO WE20

screening readings were below 1 ppm. MW220 was screened from 5 to 20 ft. bgs in the overburden to target the interval intersecting the water table.

**MW221:** Subsurface material encountered at this location included a thin layer of asphalt pavement (0 to 0.33 ft. bgs), silty sand with gravel (0.33 to 4 ft. bgs), poorly graded sand with gravel (4 to 5 ft. bgs), poorly graded sand (6 to 7 ft. bgs), and silty sand and gravel (8 to 15.3 ft. bgs). All PID jar headspace screening readings were below 1 ppm. MW221 was screened from 3 to 15 ft. bgs in the overburden material to target the interval intersecting the water table.

**MW222:** Monitoring well MW222 was installed in the central portion of the northern waterfront area. Subsurface soil encountered at this location included well graded sand with silt and gravel (0 to 1.5 ft. bgs), well graded sand with gravel (2 to 5.5 ft. bgs), poorly graded sand (6 to 14 ft. bgs), silt with gravelly/sandy matrix (14 to 24.9 ft. bgs). The maximum jar headspace PID screening result was documented at 3.7 ppm at the 0 to 2 ft. bgs. MW222 was screened from 4 to 14 ft. bgs in the overburden to target the interval intersecting the water table.

**MW02A:** Monitoring well MW02A was installed to the original well which could not be located. Subsurface material encountered at this location included a thin asphalt layer (0 to 0.5 ft. bgs), silty gravel with sand (0.5 to 1.0 ft. bgs), silty sand (1.0 to 25.6 ft. bgs), and poorly graded gravel with silt and sand (25.6 to 26 ft. bgs). Because this was a replacement well, headspace readings were not recorded. MW02A was screened from 16 to 26 ft. bgs to mimic the screen location of the original monitoring well (MW02). A soil gas probe was also installed at this location.

**MW11A**: Monitoring well MW11Awas installed at the northern waterfront area south of pier 2 (location of a historic monitoring well) using the DPT drilling technique. This soil boring was completed as a temporary monitoring well (MW11A) because the original monitoring well (MW11) could not be located. In addition, the location is an active construction area where a permanent monitoring well would have likely been destroyed. The original well was installed using the HSA drilling technique and screened from 19 to 29 ft. bgs. This replacement well was screened from 5 to 10 ft. bgs due to depth limitations using the DPT rig and the need to collected soil gas samples above the higher water table.

**MW223:** Monitoring well MW223 was installed in an upgradient/background location at the former fleet parking area. This well was completed as a bedrock well because groundwater was not encountered in the overburden. Subsurface soil encountered at this location included gravelly sand (0 to 2 ft. bgs), silty gravel (2-4 ft. bgs), well graded sand with silt and gravel (4 to 4.3 ft.

bgs.), silt with gravel (4.3 to 6 ft. bgs), sandy silt with gravel (6 to 25.8 ft. bgs), shale or weathered phyllite (25.8 to 28 ft. bgs,), and bedrock (28 to 47 ft. bgs). Jar headspace readings were not recorded because no soil samples were collected from this location. MW223 was screened from 41 to 51 ft. bgs in bedrock to target the interval intersecting the bedrock water table.

#### 3.2 GROUNDWATER SAMPLING

Groundwater sampling was conducted to identify contaminants present, if any, their impacts on groundwater quality, and to provide information on the groundwater elevations and flow dynamics across the Site. This subsection provides an overview of the groundwater sampling efforts, including summaries of the monitoring well installation methods, well construction details, groundwater sampling methodology, and field measurements and observations associated with the groundwater investigation conducted at the Site. Locations of groundwater monitoring wells are presented on Figure 3-1. Soil boring logs, well boring logs, and groundwater monitoring well construction logs are presented in Appendix B. A detailed evaluation of groundwater sample analytical data is presented in Section 4.0.

Nine additional monitoring wells and three existing monitoring wells were sampled across the Site as part of the SASE Addendum field efforts completed by Tetra Tech. Monitoring well locations were chosen to further investigate areas of suspected groundwater quality impacts based upon historical information. As previously described in Section 3.1.2, one monitoring well was screened in bedrock, while the remaining monitoring wells were screened across the overburden water table interface. At each monitoring well location, a boring was advanced down to refusal, or to a targeted depth (i.e. locations MW11A and MW02A). Soil samples were only collected at one location (MW204), in accordance with the Work Plan Addendum.

The monitoring wells were constructed of 2-inch ID, flush-threaded, Schedule 40 polyvinyl chloride (PVC) screen and riser. 10-slot (0.010 in) well screens were installed in lengths ranging from 5 to 15 ft. The well annulus was backfilled with No.1 silica (quartz) sand filter-pack to at least 1 ft. above the top of the well screen, and a minimum 2 ft. thick seal consisting of bentonite chips was placed above the sand pack. Cement/bentonite grout was placed in the well annulus from the top of the bentonite seal to the ground surface. A concrete surface seal was placed at each well surrounding the casing, excluding monitoring well MW-11A (temporary well). Table 3-3 presents a summary of monitoring wells that were installed and provides details on the construction of the wells installed as a part of this SASE Addendum.

# 3.2.1 <u>Monitoring Well Installation</u>

A total of nine monitoring wells (eight overburden and one bedrock) were installed during the February-March 2011 field event. One of the eight overburden monitoring wells (MW11A) was completed as a temporary well using DPT drilling techniques and the remaining seven overburden wells (MW02A, MW218, MW219, MW204, MW220, MW221, and MW222) were completed as permanent wells installed using HSA drilling methods. With the exception of MW02A, the well depths, screen placement, and screen lengths of the permanent overburden wells were chosen based upon jar headspace PID screening and field observations obtained from split-spoon soil sampling. The well depth, screen placement, and screen length for replacement well MW02A was identical to that of the well being replaced (MW02).

The one bedrock monitoring well (MW223) was completed as a permanent well using the HSA drilling methods. This well served to provide upgradient data for the Northern Waterfront monitoring wells. The bedrock monitoring well screen was set at 41 to 51 ft. bgs.

# 3.2.2 Groundwater Monitoring Well Development and Water Level Measurements

Nine new and three existing monitoring wells were developed during the February-March 2011 sampling event. For newly installed monitoring wells, development was conducted no sooner than three days after well installation. Each well was developed by removing water with 1/2-in ID, 5/8-in OD low density polyethylene (LDPE) tubing fitted with a check valve and driven by a Waterra pump. During well development, water quality parameters (stabilization criteria) were monitored, including: pH, conductivity, temperature, and turbidity. The objective of the well development program was to establish connectivity with the aquifer by removing fine-grained sediments from the soil formation within the vicinity of the well screen, pumping until the water quality parameters stabilized, optimally achieving a turbidity of less than 10 Nephelometric Turbidity Units (NTUs).

None of the monitoring wells achieved these optimum stabilization criteria because the silty nature of the soil in the area created high turbidity conditions in the wells. Final turbidity levels in one monitoring well (MW-218 at 12.3 NTUs) approached the 10 NTU criteria, but the remaining wells were well above the turbidity stabilization goal (85.1 to 1456 NTUs). Turbidity readings for two of the eleven monitoring wells (MW-204 and MW-222) were either not measured or measured inconsistently due to an equipment malfunction. A summary of the well development data, including the final stabilization criteria readings, is provided in Table 3-4. Well development logs are provided as part of the field documentation forms in Appendix A.

During groundwater sampling efforts, depths to groundwater (recorded as static water levels on the low flow log sheet) ranged from approximately 5.09 (MW222) to 14.91 (MW218) ft. below top of the PVC riser pipes across the site. The depth to water in temporary monitoring well MW11A (6.11 ft. bgs) was measured from the ground surface. The top of the water column was gauged in each monitoring well with an oil-water interface probe to check for the potential presence of light non-aqueous phase liquids (LNAPLs). LNAPL was not detected in any of the monitoring wells gauged during this investigation.

Survey activities to document elevation and horizontal location data for each of the newly installed groundwater monitoring wells, soil borings, and soil gas sample collection points were conducted on April 2011. The horizontal control datum was North American Datum (NAD) 1983 and the vertical control datum was National Geodetic Vertical Datum (NGVD) 1929. The elevations of each well's outer protective casing and the top of the PVC inner riser pipe were surveyed to the nearest one-hundredth of a foot (0.01 ft.). The ground adjacent to each well and the soil boring locations were surveyed to the nearest one-tenth of a foot (0.1 ft.). The well coordinates and elevations are provided in Table 3-3.

## 3.2.3 Groundwater Sample Collection

Groundwater sampling was conducted from February 24, 2011 through March 17, 2011. Groundwater samples for laboratory analysis were collected from nine newly-installed monitoring wells and from three existing monitoring wells. All monitoring wells were sampled using low stress (low-flow) purging and sampling procedures according to the GW-001 USEPA Region I low-flow SOP, as presented in Appendix D.

Dedicated tubing was used in each monitoring well to minimize potential cross-contamination between monitoring wells during well purging efforts. Water level, drawdown, and flow rate were recorded on low-flow groundwater sample log sheets. Groundwater was pumped through a flow-through cell which allowed measurements of pH, specific conductance, temperature, dissolved oxygen (DO) oxidation-reduction potential (ORP), and salinity. Turbidity was measured separately with a nephelometer. These field indicator parameters were all recorded on low-flow groundwater sample log sheets, provided as part of the field documentation forms in Appendix A. No PID positive detections, odors, or sheens were noted during the purging and sampling event, or during previous well development activities.

Approximately six to thirty-three liters of groundwater were purged from each monitoring well prior to stabilization of sampling criteria, as documented in Table 3-5. Final turbidity values of less than 5 NTUs were recorded in 6 of the 12 monitoring wells sampled. Final turbidity values in the remaining wells

W5211766F 3-11 CTO WE20

ranged from 7.36 NTUs (MW11A) to 50 NTUs (MW223). Drawdown levels during the final three readings (stabilization time) did not exceed 0.3 ft. in any of the monitoring wells.

Groundwater samples collected from all monitoring wells were analyzed for VOCs, and samples collected from selected monitoring wells (MW08, MW204, MW218, and MW219) were also analyzed for PAHs and for total and dissolved Target Analyte List (TAL) metals. The associated field forms are presented in Appendix A.

#### 3.3 SOIL-GAS SAMPLE COLLECTION

Soil-gas sampling was conducted on February 24 and March 3, 2011. Soil-gas samples were collected from four locations (co-located with monitoring wells) as depicted on Figure 3-1.

Prior to sampling, vapor probes were advanced using a DPT rig. After installation, the vapor probes were sealed from the atmosphere using modeling clay and then leak tested to verify the seal integrity. Using a vacuum pump calibrated to a flow rate of 200 milliliters per minute (ml/min), three probe volumes (volume of the soil vapor sampling probe and attached tubing) of soil gas was purged into a 3 liter (L) polyethylene (PE) bag. A PID was used to screen the collected soil vapor for total VOCs and a helium detector was again used to evaluate the bag seal. Following a successful leak test, a 1 hour purge was allowed before attaching and filling a clean 6 L Summa canister for submittal to the laboratory for analysis and reporting.

Prior to moving to a new sample location, the probe rods were removed from the subsurface and scrubbed with a detergent solution before being rinsed with potable and then distilled water. Dedicated tubing was used at each soil gas sampling station to minimize the potential for cross-contamination. All field measurements and notable observations made during soil gas sampling were recorded on sample log sheets, provided as part of the field documentation forms in Appendix A. A summary of the field measurements collected during soil gas sampling program is provided in Table 3-6.

Four soil-gas (SG) samples (SG-MW02A, SG-MW03, SG-MW11A, and SG-MW12) were collected and submitted for VOC laboratory analysis via USEPA Method TO-15. All samples were collected below a depth greater than 5 ft. bgs (deep SG), except SG-MW11A which was collected from 2 to 3 ft. bgs, a shallow SG interval.

Soil profile observations were recorded during the installation of MW02, MW03, MW11, and MW12 in 1996. The uppermost surficial materials in the Northern Waterfront area were described primarily as gravelly sands, silty sands, and fine to medium poorly graded sands with varying proportions of silt,

W5211766F 3-12 CTO WE20

gravel, and traces of shell fragments in some soils. These sands continue at the deepest borings to approximate depths between 10 ft. bgs at (MW03) to 24 ft. bgs (at MW02), and are underlain by a tight and dense, silty, gravelly, sand with trace clay (probable till). The probable till, encountered above weathered bedrock, varied between approximately 8 ft thick at MW03 to approximately 12 ft thick at MW04.

During the advancement of vapor probes at location SG-02A, the encountered material included a thin asphalt layer (0 to 0.5 ft. bgs), silty gravel with sand (0.5 to 1.0 ft. bgs), silty sand (1.0 to 25.6 ft. bgs), and poorly graded gravel with silt and sand (25.6 to 26 ft. bgs).

### 4.0 ANALYTICAL RESULTS

This section presents a discussion of the analytical results from environmental media samples that were collected and analyzed in 2011 as part of this SASE Addendum investigation. Analytical results for contaminants present at concentrations greater than the laboratory instruments detection limits are summarized in Tables 4-1 through 4-4. The complete analytical results can be found in Appendix E.

#### 4.1 SAMPLE ANALYSIS AND DATA VALIDATION

Soil, groundwater, and soil gas samples were collected and analyzed in accordance with the SASE Work Plan Addendum (Tetra Tech, 2011). Laboratory analysis was conducted under USEPA SW-846 for VOCs was by Method 8260B, PAHs by Method 8270C, PCBs by Method 8082, DRO and GRO by Method 8015B, and metals by Methods 6010C, 7470A and 7471A. Soil-gas samples were analyzed for VOCs by USEPA TO-15 Air Compendium Method.

Petroleum hydrocarbons (extractable) were analyzed using a gas chromatography/flame ionization detector (GC/FID) method (USEPA Method 8015B) modified for quantification of extractable petroleum hydrocarbons in the C-8 to C-40 range. Results from this analysis were reported as DRO. In addition, GRO analysis provided quantification of petroleum hydrocarbons in the C-6 to C-10 range. Both DRO and GRO results are discussed in the text of this section as petroleum hydrocarbons.

All the laboratory data results were validated by Tetra Tech chemists according to established USEPA Region I data validation guidelines. A Tier II level data validation was performed for the VOC, SVOC, PAH, pesticide, PCB, GRO, DRO, and metals results.

In general, data were found to be acceptable for use in this SASE and for evaluation of risk under Comprehensive Environmental Response Compensation and Liability Act (CERCLA) and USEPA protocols. Qualifications on the reported data are documented in the data validation memoranda for each data package provided by the analytical laboratory. Data validation memoranda are presented in Appendix E of this report.

The discussion in this section contains summaries of analytical results along with comparisons of detected contaminant levels to comparison criteria as described in Section 4.1.1 of the On-Shore Derecktor Shipyard Work Plan Addendum (Tetra Tech, 2011).

W5211766F 4-1 CTO WE20

#### 4.2 SUMMARY OF ANALYTICAL RESULTS

Data discussions in this section focus on the maximum concentrations of chemical contamination detected. Concentrations of chemical contamination are presented in summary Tables 4-1 through 4-4, for each environmental media that was sampled.

Analytical results for field duplicate samples were averaged with the original sample results. Sample stations where this calculation was performed are identified with the suffix "-AVG". For instances where two positive or non-detected results were reported, the results were added together and divided by two. For instances where one positive result and one non-detect result were reported, the positive result was added to one-half the undetected result and then divided by two. If the non-detect result was elevated due to dilutions, the positive result was used for the average.

Contaminant-specific concentrations were compared to project action levels (PALs) established in the Work Plan Addendum. PALs for soil consisted of the lowest of the USEPA Regional Screening Levels (RSLs) (2011) and the RIDEM Residential Soil DEC. PALs for groundwater consisted of the lowest of USEPA maximum contaminant levels (MCL) and the RIDEM GA groundwater aquifer criteria. PALs for soil gas were derived from USEPA residential air RSLs adjusted by an attenuation factor of 0.01 for deep soil gas samples. In addition, RSLs adjusted by an attenuation factor of 0.1 for shallow soil gas were presented for comparison purposes.

The NAVSTA Newport Basewide Background Study (Tetra Tech, 2008) was used to establish background concentrations for inorganics. The ProUCL software program was used to calculate the 95% Upper Predictive Limit (UPL) to be used as a background threshold value (BTV) for Site 19 – On-Shore Derecktor Shipyard. 95% UPLs were calculated from the base background dataset for all surface and subsurface soil types. The soil types were combined because the soil type at the Site is classified as urban fill and is likely a combination of different soil types from other portions of NAVSTA Newport. The background analysis is included in Appendix G-1.

## 4.2.1 Southern Waterfront Area

## Subsurface Soil

Two borings, SB201 and SB202, were advanced in former berm Section 6 of the Southern Waterfront area to a depth of 2 to 4 ft bgs. Subsurface soil samples were collected from below the topsoil layer and analyzed for PAHs and metals to confirm no residual contamination is present. Analytical results indicated no PAHs present above the laboratory instruments method detection limits. The following metals were detected above USEPA RSLs in both samples: aluminum, arsenic, chromium, cobalt, iron,

and manganese. All concentrations were above the 95% UPL background concentrations, except for chromium in SB202, and manganese in both samples. Beryllium was also detected above the Rhode Island (RI) Residential DEC in SB201, but not above the 95% UPL background concentration. Chemicals of concern (COCs) in the stockpiles created during the removal actions conducted at the southern waterfront included PAHs, arsenic, and lead. In the 2011 samples, lead was detected at a maximum of 13.6 J milligrams per kilogram (mg/kg) in SB202 and arsenic at a maximum of 26.3 mg/kg in SB202. Concentrations of select PAHs and metals are presented in Figure 4-1. Table 4-1 presents a summary of the results for analytes that were present at levels greater than detection limits. Complete analytical results can be found in Appendix E.

## 4.2.2 <u>Building 234 Area</u>

## Sump 234-4 Exploratory Boring - Subsurface Soil

Exploratory borings were advanced to confirm the presence of a concrete bottom in Sump 234-4. Two hand auger borings indicated that an intact concrete bottom was present in the vicinity of the boring. In an effort to further delineate the extent of the concrete flooring three additional DPT borings were advanced to confirm the presence of a concrete bottom. No samples were submitted for laboratory analysis at this location since each exploratory boring confirmed the presence of fill material and a concrete bottom.

#### MW-08 - Groundwater

North of former Building 234 an existing overburden monitoring well (MW08) was sampled to investigate any potential impacts to groundwater quality from the former location of USTs and a machine shop to the shallow overburden aquifer. One overburden groundwater sample was collected from MW08 and analyzed for VOCs, PAHs, and metals (total and dissolved).

Five chlorinated VOCs (1,1-dichloroethene, cis-1,2-dichloroethene, TCE, trichlorofluoromethane, and vinyl chloride) were detected during the March 2011 groundwater sample round at concentrations below groundwater PALs, as illustrated in Figure 4-2. No PAHs were detected above the laboratory's instrument method detection limits. A total of 14 metals were detected in MW08 total and dissolved sample fractions at concentrations below criteria. Table 4-2 presents a summary of the results for analytes that were present at levels greater than detection limits in groundwater samples.

# 4.2.3 Central Shipyard - Building 42 ("Hotspot" Excavation Area and Downgradient of Sump S42-1)

## Monitoring Wells MW-218 and MW-219

Shallow overburden groundwater at MW-218, was collected to investigate potential contamination associated with a past TPH source investigation. Former location TP-25 associated with the source investigation had elevated FID readings and an observable sheen at the water table. The groundwater samples collected during the February - March 2011 sample round were analyzed for VOC, PAHs, and metals. No VOCs or PAHs were observed above the laboratory instruments method detection limits in groundwater. Both total and dissolved arsenic were present at concentrations 2.8 and 2.9 times greater than the MCL, respectively. Table 4-2 presents a summary of the results for analytes that were present at levels greater than the laboratory instruments method detection limits in groundwater samples.

MW-219 was installed to investigate potential overburden groundwater contamination downgradient of former paint/solvent sump S42-1. Groundwater samples were collected for VOCs, PAHs, and metals. Acetone was the only VOC detected in the groundwater sample. It was present in the duplicate sample but was not found above the laboratory instruments method detection limits in the original sample. No PAHS were detected above the laboratory instruments method detection limits. A total of 14 total metals and 13 dissolved metals were detected in groundwater. Concentrations of total and dissolved arsenic were detected at levels more than 7 times greater than the MCL (10 micrograms per liter [µg/L]). There were no other exceedences of metals criteria in groundwater. Figure 4-2 presents concentrations of selected analytes (VOCs and arsenic) for this location.

## 4.2.4 PCB Removal Area - Building 6/Test Pit 14/Area

#### Surface Soil

Surface soil samples were collected from two borings, SB208 and SB209, advanced in the vicinity of the Building 6/TP-14 PCB removal area and submitted for DRO/GRO, PAHs, PCBs, and metals analyses.

DRO was detected below the RIDEM DEC with concentrations ranging from 35.5 mg/kg (SB208-D) to 366 mg/kg (SB209). GRO was also detected below RIDEM DEC in SB208 (2.83 mg/kg) and its duplicate sample SB208-D (4.82 J mg/kg).

Aroclor 1260 was detected with concentrations ranging from 24.2 J micrograms per kilogram ( $\mu$ g/kg) (SB208-D) to 416 J  $\mu$ g/kg (SB209). The concentration detected in SB209 exceeded the USEPA criteria of 220  $\mu$ g/kg.

Seventeen PAHs were detected, with eight PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene) exceeding criteria. Three exceedences of PAH criteria were detected in SB208, one exceedence of benzo(a)pryene criteria was in SB208-D, and eight exceedances of PAH criteria were in SB209.

Twenty metals were detected in surface soil, with seven (aluminum, arsenic, beryllium, chromium, cobalt, iron, and manganese) exceeding USEPA RSL criteria. The maximum concentrations of the seven exceedances occurred in either SB208 or its duplicate. Background concentrations were not exceeded for aluminum arsenic, beryllium, chromium, cobalt, iron, and manganese in SB209; and chromium in both locations. Soil concentrations of selected PAHs, PCB, and, metals (arsenic and chromium) are presented in Figure 4-3.

#### Subsurface Soil

Five subsurface soil samples, SB210 through SB214, were collected laboratory analyses and reporting of DRO/GRO, PAHs, PCBs, and metals in the vicinity of the Building 6/TP-14 PCB removal area.

DRO was detected below criteria with concentrations ranging from 17.8 mg/kg (SB212) to 48.2 mg/kg (SB211). GRO was not present above the laboratory instruments method detection limits. PCBs were not detected above the laboratory instruments method detection limits in any sample.

Seventeen PAHs were detected in subsurface soil, with four PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene) exceeding criteria. Exceedances of each of the four PAH criteria were detected in SB214, while the only exceedance recorded in the remaining three locations was for benzo(a)pyrene.

Twenty-one metals were detected in subsurface soil, with five of those metals (arsenic, beryllium, chromium, iron, and manganese) exceeding criteria in all five samples. Aluminum and cobalt exceeded their respective standards in four samples. Background concentrations were exceeded for arsenic, chromium, and manganese in SB214; and beryllium in SB212 and SB214. Soil concentrations of selected PAHs, PCBs, and metals are presented in Figure 4-3.

## 4.2.5 PCB Removal Area - Building 6/Test Pit 14/Area (Transformer Bank)

## Surface Soil

Four soil borings (SB215, SB216, SB217, and SB224) were advanced in the vicinity of the transformer bank located in the Building 6/TP-14 PCB removal area. Surface soil samples collected from the borings

were analyzed for PCBs. Analytical results indicated that no PCBs were present above the laboratory instruments method detection levels.

## 4.2.6 Northern Waterfront - Huts 1 and 2

Four borings, SB204 through SB207 were advanced in the vicinity of Huts 1 and 2 to investigate potential releases associated with a former vehicle maintenance area. Surface and subsurface soil samples were collected and analyzed for VOCs, DRO/GRO, PAHs, and TAL metals. Boring SB204 was completed as monitoring well MW204. The groundwater sample collected from this location was analyzed for VOCs, PAHs, and TAL metals (total and dissolved).

#### Surface Soil

The following VOCs were detected in surface soil: 2-butanone, 2-hexanone, acetone, and carbon disulfide. Acetone was detected in four of the five samples in which it was analyzed, while the remaining VOCs were only detected once in surface soil. Each of the four VOCs detected in surface soil were below criteria.

DRO was detected in three of the five samples collected with concentrations ranging from 12.8 mg/kg (SB204-D) to 31.6 mg/kg (SB207). Detected DRO concentrations were at least an order of magnitude less than the soil DEC. No GRO was detected above the laboratory instruments method detection limits in the surface soil.

Seventeen PAHs were detected in surface soil, with four PAHs (benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene) exceeding RSLs. Exceedances of PAH criteria were recorded in only two of the four samples (SB205 and SB207). Four PAHs were detected above criteria in SB205 (benzo(a)anthracene [232 J  $\mu$ g/kg], benzo(a)pyrene [165  $\mu$ g/kg], benzo(b)fluoranthene [263  $\mu$ g/kg], and dibenzo(a,h)anthracene [124  $\mu$ g/kg]) and only one PAH was detected above criteria in SB207 (benzo(a)pyrene 29.6 j  $\mu$ g/kg). No PAHs were detected in SB204-D.

Nineteen metals were detected in surface soil, with seven of those metals (aluminum, arsenic, beryllium, chromium, cobalt, iron, and manganese) exceeding criteria. Arsenic, chromium, cobalt, and iron, exceeded their respective criteria in each of the sample locations. Beryllium exceeded criteria in two sample locations (SB205 and SB207), and aluminum and manganese exceeded criteria in one location (SB205). Background concentrations were only exceeded for beryllium, cobalt, and iron in SB205. Concentrations of selected PAHs and metals are presented in Figure 4-1.

W5211766F 4-6 CTO WE20

#### Subsurface Soil

Two VOCs, carbon disulfide and m+p xylenes were detected once in SB204 (2.8 J  $\mu$ g/kg) and SB205 (2.6 J  $\mu$ g/kg), respectively. The concentration of carbon disulfide was more than four orders of magnitude less than the regulatory criteria. There was no applicable standard for comparison to m+p xylene.

DRO was detected in one of the four subsurface soil sample collected (SB204 at 7.49 mg/kg) at a concentration two orders of magnitude less than the RIDEM DEC. No GRO was detected above the laboratory instruments method detection limits in the subsurface soil.

Sixteen PAHs were detected in subsurface soil, with two PAHs (benzo(a)pyrene at 23.3 μg/kg and dibenzo(a,h)anthracene at 23.3 μg/kg) exceeding criteria in sample SB205. Both exceedances were recorded in SB205. PAHs were not detected in SB204 or SB206.

Eighteen metals were detected in subsurface soil, with four metals (arsenic, chromium, cobalt, and iron) exceeding criteria. Maximum concentrations of arsenic (9.78 mg/kg), cobalt (5.85 mg/kg), and iron (20,900 mg/kg) were found in SB207. The maximum concentration of chromium was found in SB205 (9.49 mg/kg). None of the detected concentrations exceeded background concentrations. Concentrations of selected PAHs and metals are presented in Figure 4-1.

#### Groundwater

Analytical results indicated the presence of one VOC, TCE (3.16 µg/l) in groundwater monitoring well MW204. There were no exceedances of VOC USEPA MCL criteria in groundwater. There were no PAHs present above detection limits. A total of 11 total and dissolved metals were detected in groundwater with no exceedances of criteria. Concentrations of select VOCs are presented in Figure 4-2.

#### 4.2.7 Northern Waterfront

## Groundwater

Eight groundwater monitoring wells were sampled for VOCs in the Northern Waterfront Area. One monitoring well (MW02A) was installed west of former oil discharge area to investigate potential groundwater contamination in the vicinity of areas of former oil discharges. Three monitoring wells (MW03, MW220, and MW221) were installed to investigate impacts of the hazardous waste storage area to groundwater quality in the area. Two additional monitoring wells (MW11 and MW12) were sampled to assess impacts of former storage areas and other disposal on deep overburden groundwater. One monitoring well (MW222) was sampled to investigate potential groundwater contamination in the center of the northern waterfront area, and one monitoring well (MW223) was installed to provide an upgradient groundwater data point. One duplicate sample (MW11A-D) was collected from MW11.

Five chlorinated VOCs (cis-1,2-dichloroethene, tetrachloroethene, trans-1,2-dichloroethene, TCE, and vinyl chloride) were detected in northern waterfront groundwater samples above the laboratory instruments method detection limits during the February/March 2011 groundwater sample round. TCE was the only VOC to exceed the PAL (5  $\mu$ g/L). TCE exceeded criteria in five of the 8 monitoring wells in which it was sampled with concentrations ranging from 4.97  $\mu$ g/L (MW11A-D) to 12.2  $\mu$ g/L (MW221).

At least one VOC was present above detection limits in each of the northern waterfront area wells, with the exception of MW223, the northern waterfront area background well. Concentrations of select VOCs are presented in Figure 4-5. Table 4-3 presents a summary of the results for analytes that were present at levels greater than detection limits in groundwater samples. A full list of results for all parameters that were analyzed for can be found in Appendix C.

## Soil Gas

Three deep soil gas stations (SG-MW02A, SG-MW03, and SG-MW12) and one shallow soil gas station (SG-MW11A) were sampled in the Northern Waterfront Area during the February/March 2011 soil gas sample round. Soil gas sample stations were collocated with the following northern waterfront area monitoring wells: MW2A, MW03, MW11A, and MW12. One duplicate sample (SG-MW03-D) was collected from SG-MW03. Soil gas samples were analyzed for VOCs as described in Section 3.3.

Thirty-three VOCs were detected in the Northern Waterfront Area. At the deep soil gas stations, no VOCs were detected above USEPA deep soil gas criteria adjusted by the 0.01 attenuation factor. At the shallow soil gas station, SG-MW11A, five VOCs (1,3-butadiene, acrylonitrile, benzene, tetrachloroethene, and TCE) were present above shallow soil gas criteria adjusted by the 0.1 attenuation factor. Select concentrations of VOCs are presented in Figure 4-6. Table 4-4 presents a summary of the results for analytes that were present at levels greater than detection limits in soil gas samples. A full list of results for all parameters that were analyzed for can be found in Appendix C.

W5211766F 4-8 CTO WE20

## 5.0 HUMAN HEALTH RISK ASSESSMENT

This section presents the HHRA for the Site and is an update of the HHRA presented in the SASE Report (B&RE, June 1997). The HHRA was updated to incorporate changes in the risk assessment methodology since the original HHRA was prepared and to include additional data that has been collected at the Site since that time. The objective of the HHRA is to determine whether exposure to chemicals in the study area pose a potential unacceptable risk to potential human receptors. The potential risks to human receptors are estimated based on the assumption that no actions are taken to control contaminant releases.

The following current guidance and reports published by the Navy, the USEPA, and the State of Rhode Island were considered in the preparation of this document:

- Conducting Human Health Risk Assessments under the Environmental Restoration Program (Navy, February 2001).
- Navy Policy on the Use of Background Chemical Levels (Navy, January 2004).
- U.S. Navy Human Health Risk Assessment Guidance (Navy, December 2008)
- Rules and Regulations for the Investigation and Remediation of Hazardous Material Releases (RIDEM, 2011).
- Risk Assessment Guidance for Superfund: Volume I, Human Health Evaluation Manual (Part A) (USEPA, December 1989).
- Soil Screening Guidance: Technical Background Document (USEPA, May 1996).
- Exposure Factors Handbook (USEPA, August 1997).
- Calculating Upper Confidence Limits for Exposure Point Concentrations at Hazardous Waste Sites (USEPA, December 2002).
- Guidance for Characterizing Background and Chemical Concentrations in Soil for CERCLA Sites (USEPA, December 2002).
- Risk Assessment Guidance for Superfund, Volume I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment) (USEPA, July 2004).
- Guidelines for Carcinogen Risk Assessment (USEPA, March 2005).
- Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens (USEPA, March 2005).
- Risk Assessment Guidance for Superfund, Volume I: Human Health Evaluation Manual (Part F, Supplemental Guidance for Inhalation Risk Assessment) (USEPA, January 2009).

The HHRA is structured and reported according to the guidelines of the Risk Assessment Guidance for Superfund (RAGS), Human Health Evaluation Manual, Part D: Standardized Planning, Reporting, and Review of Superfund Risk Assessments (RAGS Part D) (USEPA, December 2001). The assessment follows the methodology used for the HHRAs for Site 8 (Tetra Tech, January 2010) and Tank Farm 4 and 5 (Tetra Tech, January 2011).

This HHRA consists of five components: data evaluation, exposure assessment, toxicity assessment, risk characterization, and uncertainty analysis. Sections 5.1 through 5.6 contain detailed discussions of the six components of the HHRA.

Three major aspects of chemical contamination and environmental fate and transport must be considered to evaluate potential risks: (1) contaminants with toxic characteristics must be found in environmental media and must be released by either natural processes or by human action; (2) potential exposure points must exist; and (3) human receptors must be present at the point of exposure. Risk is a function of both toxicity and exposure. If any one of these factors is absent for a site, the exposure pathway is incomplete, and no potential risks are considered to exist for human receptors.

#### 5.1 DATA EVALUATION

Data evaluation, the first component of a baseline HHRA, is a medium-specific task involving the compilation and evaluation of analytical data. The second step (and the main objective) of the data evaluation is to develop a medium-specific list of chemicals of potential concern (COPCs) that will be used to quantitatively and/or qualitatively determine potential human health risks for site media. COPCs are selected primarily based on a risk-based screen (i.e., a comparison of site contaminant concentrations to conservative risk-based screening values) and a background screen (i.e., a comparison of site concentrations to background concentrations).

## 5.1.1 <u>Data Usability</u>

Soil and groundwater samples from the SASE Report (B&RE, January 1997) and soil, groundwater, and soil gas samples from the 2011 field investigation were used in this HHRA. As discussed in Section 2, several non-time critical removal actions (NTCRA) were completed from 1997 to 2007 at the Site. Samples located in the areas where the removal actions occurred have been removed from the database and were not used in this HHRA. Both the historical samples and 2011 samples were used to select COPCs. Surface soil samples at the Site include those from the 0 to 1 ft. bgs, 0.5 to 1.5 ft. bgs, and 0 to 2 ft. bgs.

Only the 2011 groundwater samples were used to quantify risks to groundwater, since this data is representative of the current conditions at the Site. Both total (unfiltered) and dissolved (filtered) groundwater sampling results are presented in the COPC selection tables although only the total results were used to quantify risks.

Field measurements and data regarded as unreliable (e.g., qualified as "R" during the data validation process) were not used in the quantitative HHRA. The maximum of the original and duplicate sample was used in the selection of COPCs. Samples used in this HHRA are listed on the COPC selection tables and in Appendix F.1.

## 5.1.2 <u>Selection of Chemicals of Potential Concern</u>

The selection of COPCs is a quantitative screening process used to limit the number of chemicals and exposure routes quantitatively evaluated in the baseline HHRA to those site-related constituents that dominate overall potential risks. Screening by risk-based concentration (RBC) is used to focus the risk assessment on meaningful chemicals and exposure routes.

In general, a chemical is selected as a COPC and retained for further quantitative risk evaluation if the maximum detection in a sampled medium exceeds the lowest RBC and for inorganics is present above background levels. Chemicals eliminated from further evaluation are assumed to present minimal risks to potential human receptors. Medium-specific tables summarizing the selection of COPCs are included in the risk assessment.

## 5.1.2.1 Derivation of Screening Criteria

The primary criteria used to identify COPCs are based on USEPA RSLs (May 2012) and criteria established by the RIDEM, Office of Waste Management (November 2011) as discussed in the Work Plan Addendum 1 (February, 2011). The RIDEM criteria are being used in this HHRA because they were used in the previous HHRA (B&RE, June 1997). The RSLs were developed and are maintained through a cooperative agreement between Oak Ridge National Laboratory (ORNL) and USEPA's Office of Superfund, and are considered to be USEPA screening criteria. The RSLs are based on exposure pathways for which generally accepted methods, models, and assumptions have been developed (i.e., ingestion, dermal contact, and inhalation) for specific land-use conditions and do not consider impact to groundwater or ecological receptors. The screening concentrations based on the RSLs correspond to a systemic hazard quotient (HQ) of 0.1 for non-carcinogens or an incremental lifetime cancer risk (ILCR) of 1x10<sup>-6</sup> for carcinogens. The RSLs for non-carcinogens are based on an HQ of 1, whereas the screening

concentrations used in the selection of COPCs were based on an HQ of 0.1 to account for the potential cumulative effects of several chemicals affecting the same target organ or producing the same adverse non-carcinogenic effect. The RIDEM criteria include residential direct contact exposure criteria, leachability criteria (classification GA), and GA groundwater objectives.

The COPC screening levels used for each medium in the risk assessment are discussed below.

## **Screening Levels for Soil**

Screening levels based on the following criteria were used to select COPCs for surface and subsurface soil:

- RSLs for residential soil (USEPA, May 2012)
- RIDEM DECs for residential soil (November 2011)

Maximum chemical concentrations in soil were also compared to USEPA risk-based soil screening levels (SSLs) for groundwater protection and to RIDEM GA leachability criteria that were designed to be protective of groundwater at most sites. Existing groundwater data was also used to determine if chemicals are migrating from soil and adversely impacting groundwater. The USEPA SSLs are based on a dilution attenuation factor (DAF) of 1. The SSLs for migration from soil to groundwater and the RIDEM leachability criteria were not used for the selection of COPCs for direct contact exposure; however, they do allow qualitative evaluation of the potential for chemical migration from soil to groundwater. Chemicals with concentrations exceeding the SSLs/RIDEM leachability criteria may potentially migrate from the soil to groundwater in sufficient quantities to pose groundwater quality problems.

The risk-based screening levels used in the COPC selection for soil are presented in Table 5-1.

#### **Screening Levels for Groundwater**

Screening levels based on the following criteria were used to select COPCs for groundwater and surface water:

- RSLs for tap water (USEPA, May 2012)
- RIDEM GA groundwater objectives (November 2011)
- USEPA MCLs (April 2012)

 USEPA Groundwater Screening Levels for Evaluating Vapor Intrusion into Indoor Air from Groundwater (May 2012)

Risk-based COPC screening levels for tap water ingestion, which are based on daily residential exposure assumptions, were used to select COPCs for groundwater. In general, the use of tap water screening levels is regarded as a highly conservative approach to COPC selection at the Site because groundwater is not used as a potable water source.

Screening levels from USEPA Vapor Intrusion Screening Level (VISL) Calculator Version 2.0 (USEPA, May 2012) were used for evaluating the vapor intrusion pathway from groundwater to indoor air. The values correspond to a target cancer risk level of  $1 \times 10^{-6}$ , or a hazard index of 0.1 for carcinogens and noncarcinogens, respectively. The vapor intrusion screening criteria assume a subsurface attenuation factor of 0.001 from groundwater concentrations to indoor air concentrations. The vapor intrusion screening criteria were derived to identify chemical concentrations in groundwater that may adversely affect the indoor air quality of a building overlying subsurface VOC contamination.

The risk-based screening levels and health-based standards used in the COPC selection for groundwater are presented in Table 5-2.

#### Screening Levels for Soil Gas

Soil gas screening levels for evaluating vapor intrusion to indoor air were obtained from USEPA VISL Calculator Version 2.0 (USEPA, May 2012). The soil gas criteria are based on the residential air RSLs and an attenuation factor of 0.1. The risk-based screening levels used in the COPC selection for soil gas are presented in Table 5-3.

#### **Essential Nutrients**

Per USEPA guidance (December 1989) "Chemicals that are (1) essential human nutrients, (2) present at low concentrations (i.e., only slightly elevated above natural occurring levels), and (3) toxic at very high does (i.e., much higher than those that could be associated with contact at the site) need not be considered further in the quantitative risk assessment." Examples of such chemicals are magnesium, calcium, potassium, and sodium. Based on historical information available for the Site, no unusual use or disposal of these constituents occurred at the site under investigation. Soil concentrations greater than 1,000,000 mg/kg (i.e., pure mineral intake) would be required before receptor intake would exceed

recommended daily allowance (RDA) and recommended daily intake (RDI) values. A review of currently available analytical data indicates that such concentrations have not been detected in soil at the Site.

#### **Screening Levels for Chromium**

Chromium speciation was not performed on the soil and groundwater samples collected at the site. Therefore, the screening levels for hexavalent chromium were used for the selection of COPCs.

## **Total Petroleum Hydrocarbons**

Petroleum hydrocarbons are not considered to be a CERCLA contaminant. In addition there is no toxicity criteria available to evaluate risks from exposures to petroleum hydrocarbons. Therefore, petroleum hydrocarbons are not evaluated in this HHRA. Petroleum hydrocarbons are discussed in Section 4.2 (Summary of Analytical Results) and in the 1997 SASE Report.

#### **Chemicals without Toxicity Criteria**

Due to the lack of toxicity criteria, USEPA RSLs are not available for some chemicals [e.g., acenaphthylene, benzo(g,h,i)perylene, phenanthrene, alpha- and gamma-chlordane, monobutyltin, and tetrabutyltin]. For COPC screening, acenaphthene was used as a surrogate for acenaphthylene, pyrene was selected as a surrogate for benzo(g,h,i)perylene and phenanthrene, chlordane was selected as a surrogate for alpha- and gamma-chlordane, and dibutyltin and tributyltin were used as surrogates for monobutyltin and tetrabutyltin, respectively.

Direct contact chemical screening values were not available for carbazole, di-n-octyl phthalate, and creosote. Consequently these chemicals could not be quantitatively evaluated in this HHRA. In addition, screening criteria for protection of migration from soil to groundwater were not available for carbazole, creosote, dibutyltin, monobutyltin, tributyltin, and tetrabutyltin. Therefore, these chemicals were evaluated qualitatively in this HHRA. The uncertainty associated with the lack of screening levels for these chemicals is discussed in Section 5.5.1 in the Uncertainty Analysis.

## **Background Evaluation**

In accordance with Navy policy (DON, 2004) chemicals present at background concentrations were not retained as COPCs in this HHRA. The NAVSTA Newport Basewide Background Study (Tetra Tech, 2008) was used to establish background concentrations for inorganics. The ProUCL software program was used to calculate the 95% UPL to be used as a BTV for Site 19 – On-Shore Derecktor Shipyard.

95% UPLs were calculated from the base background dataset for all surface and subsurface soil types. The soil types were combined because the soil type at the Site is classified as urban fill and is likely a combination of different soil types from other portions of NAVSTA Newport. The results of background analysis are included in Appendix G-1. The background evaluation was conducted in accordance with the following Navy guidance:

 Guidance for Environmental Background Analysis, Volume I: Soil. Prepared by Battelle Memorial Institute, Earth Tech, Inc., and Newfields for the Naval Facilities Engineering Command, Washington D.C., April 2002.

In the COPC selection process, if the results of the background evaluation indicated that chemical concentrations detected in Site soils did not exceed background concentrations, that chemical was not selected as a COPC and was not carried through the quantitative risk assessment. However, chemicals present at concentrations exceeding risk-based screening criteria but not selected as COPCs on the basis of background evaluations are further discussed in the risk characterization section in Section 5.4.3.13. The results of the background comparison analysis for surface soil and subsurface soil are presented in Appendix G. No background data is available for groundwater; consequently, a background comparison could not be performed for the groundwater medium.

The elimination of chemicals as site-related COPCs on the basis of background follows Navy Policy on the Use of Background Chemical Levels (DON, 2004). This document also presents the Navy's interpretation of the USEPA guidance provided in the document titled Role of Background in the CERCLA Cleanup Program (USEPA, 2002), and details the methodology to be used in evaluating background under the Navy's Environmental Restoration and Base Realignment and Closure (BRAC) programs. Navy policy has been accepted by the USEPA as not contradicting the USEPA guidance (USEPA, 2002). Navy policy applies to both the screening-level and baseline risk assessments and requires the following:

- 1. A clear and concise understanding of chemicals released from a site thus ensuring the Navy is focusing on remediating the release.
- 2. The use of background data in the screening-level risk assessment.
  - The comparison of site chemical levels to risk-based screening criteria.
  - b. The comparison of site chemical levels to background concentrations.
  - c. The identification of site-related COPCs based on screening criteria comparisons and background comparisons. Site-related COPCs are those chemicals with concentrations

exceeding risk-based screening criteria and background concentrations. To the extent possible, site-related COPCs are further evaluated quantitatively in the baseline risk assessment. (Non-site-related COPCs are further discussed in the risk characterization sections of the baseline risk assessment.)

- 3. The consideration of background in the baseline risk assessment.
  - a. The calculation of risk estimates for site-related COPCs only.
  - b. The further evaluation of non-site-related COPCs in the risk characterization section only (e.g., the qualitative evaluation of chemicals detected at concentrations exceeding screening criteria but less than background concentrations). The Navy considers this evaluation to be consistent with USEPA's Role of Background in the CERCLA Cleanup Program (USEPA, 2002).
- 4. The selection of site cleanup remedial goals at levels not less than background levels. Additionally, cleanup levels should not be developed for chemicals not identified as COCs. As defined in the Navy guidance, COCs are site-related COPCs found to be the risk drivers in the baseline risk assessment and that may pose unacceptable human or ecological risks.

## 5.1.2.2 Decision Rules for Establishing COPCs

The following decision rules were used to select initial lists of COPCs for the Site:

- A chemical detected in soil was selected as a COPC for soil if any detected chemical concentration exceeded the USEPA or RIDEM direct contact screening levels for soil and, for inorganics, if the background evaluation indicates the site concentrations are not within naturally occurring levels. This is shown in Appendix G.
- A chemical detected in groundwater was selected as a COPC for groundwater if the maximum detected concentration in any on-site monitoring wells exceeded the USEPA or RIDEM direct contact screening levels.
- A chemical detected in soil gas was selected as a COPC for soil gas if the maximum detected concentration in soil gas exceeded the USEPA screening levels soil gas.

As indicated in Section 5.1.2.1, chemicals with concentrations exceeding the screening criteria for migration from soil to groundwater were not retained as COPCs for quantitative evaluation in the risk assessment.

## 5.1.3 COPCs Selected for the HHRA

As previously discussed in Section 1.0, the Site is divided into five areas; the North Waterfront, Central Shipyard, former Building 234, South Waterfront, and the PCB Removal area as illustrated in Figure 1-2. These areas were evaluated separately in this HHRA. Surface soil and subsurface soil samples were collected at the North Waterfront, Central Shipyard, former Building 234, and PCB removal area. Only subsurface soil samples were collected at the South Waterfront. Groundwater samples were only collected at the North Waterfront, Central Shipyard, and former Building 234 area. In addition, soil gas samples were collected at the North Waterfront.

COPCs for these areas were selected using the risk-based COPC screening levels described in Section 5.1.2. A discussion of the chemicals identified as COPCs and the rationale for COPC selection is provided in the following subsections. A discussion of nature and extent of the chemicals detected in site media is presented in Section 4.0 and is not repeated in this section. COPC selection information for each medium is presented in Tables 5-4 through 5-28. Chemicals retained as COPCs for the five areas are presented in Table 5-29. RAGS Part D tables for COPC selection are included in Appendix F.2.

#### 5.1.3.1 North Waterfront Surface Soil

Nine VOCs, 21 SVOCs, 8 pesticides, 20 inorganics, and several miscellaneous chemicals were detected in surface soil samples collected at the North Waterfront portion of the Site. A comparison of maximum detected surface soil concentrations to screening levels based on RSLs and RIDEM DECs for residential exposures is presented in Table 5-4. The following chemicals were detected at maximum concentrations exceeding direct contact COPC screening levels and were retained as COPCs for surface soil at the North Waterfront:

- SVOCs [benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene].
- Inorganics (chromium, cobalt, and iron).

The maximum detected concentration of cobalt and iron exceeded the screening toxicity levels (set at a HQ of 0.1); however, they do not exceed the RSLs. Concentrations of benzo(a)pyrene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, and chromium exceeded the screening criteria based on the RSLs, but were less than the RIDEM DECs. Concentrations of chrysene exceeded its RIDEM DEC, but were less than the screening criteria based on the RSLs. Concentrations of aluminum, arsenic, and manganese also exceeded the screening levels but were within naturally occurring levels and are not

considered to be site related (Appendix G), therefore these chemicals were not retained as COPCs for direct contact with surface soil.

A comparison of maximum detected surface soil concentrations to USEPA SSLs for chemical migration from soil to groundwater and RIDEM GA leachability criteria is presented in Table 5-5. The following chemicals were detected in surface soil at maximum concentrations exceeding the screening levels for migration from soil to groundwater at the North Waterfront:

- VOCs [benzene and TCE]
- SVOCs [benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, bis(2-ethylhexyl)phthalate, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, hexachloroethane, naphthalene, and 2,2'-oxybis(1-chloropropane].
- Pesticides (alpha-chlordane, Dieldrin, gamma-chlordane, and heptachlor epoxide).
- Metals (cadmium, chromium, copper, lead, nickel, selenium, and zinc).

Of these chemicals, only TCE, chromium, copper, nickel, and zinc were detected in groundwater samples collected at the North Waterfront. Concentrations of lead in toxicity characteristic leaching procedure (TCLP) samples also exceeded the RIDEM GA leachability criteria. Lead was the only chemical detected at concentrations exceeding the RIDEM GA leachability criteria. Concentrations of arsenic, manganese, and mercury also exceeded the screening levels but were within naturally occurring levels and are not considered to be site related (Appendix G). As discussed in Section 5.1.2.1, chemicals detected at concentrations exceeding the SSLs for migration from soil to groundwater and RIDEM GA leachability criteria were not retained as COPCs for quantitative evaluation in this HHRA.

There are no USEPA SSLs or RIDEM GA leachability criteria available for dibutyltin, monobutyltin, tetrabutyltin, and tributyltin. The uncertainty associated with the lack of screening criteria for these chemicals is discussed in Section 5.5.1, the Uncertainty Analysis.

#### 5.1.3.2 North Water Front Subsurface Soil

Seven VOCs, 18 SVOCs, 5 pesticides/PCBs, 20 inorganics, and several miscellaneous chemicals were detected in subsurface soil at the North Waterfront. A comparison of maximum detected subsurface soil concentrations to screening levels based on the RSLs and RIDEM DECs for residential exposure is presented in Table 5-6. The following chemicals were detected at maximum concentrations exceeding direct contact COPC screening levels and were retained as COPCs for subsurface soil at the North Waterfront:

- SVOCs [benzo(a)pyrene and dibenzo(a,h)anthracene]
- Inorganics (aluminum, chromium, cobalt, and iron).

Concentrations of benzo(a)pyrene, dibenzo(a,h)anthracene, and chromium exceeded screening criteria based on RSLs, but were less than the RIDEM DECs. Concentrations of arsenic and manganese also exceeded the screening levels but were within naturally occurring levels and are not considered to be site related (Appendix G); therefore these chemicals were not retained as COPCs for direct contact with subsurface soil.

A comparison of maximum detected subsurface soil concentrations to USEPA SSLs for chemical migration from soil to groundwater and RIDEM GA leachability criteria is presented in Table 5-7. The following chemicals were detected in subsurface soil at maximum concentrations exceeding the screening levels for migration from soil to groundwater at the North Waterfront:

- VOCs (TCE).
- SVOCs [benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, bis(2-ethylhexyl)phthalate), dibenzo(a,h)anthracene, and naphthalene].
- Pesticides/PCBs (Aldrin, alpha-chlordane, and heptachlor).
- Metals (arsenic, cadmium, chromium, cobalt, copper, iron, lead, mercury, nickel, and selenium).

Of these chemicals, only TCE, arsenic, cadmium, chromium, copper, iron, and nickel were detected in groundwater samples collected at the North Waterfront. Concentrations of lead in TCLP samples also exceeded the RIDEM GA leachability criteria. Lead was the only chemical detected at concentrations exceeding the RIDEM GA leachability criteria. Concentrations of manganese also exceeded the screening levels but were within naturally occurring levels and are not considered to be site related (Appendix G). As discussed in Section 5.1.2.1, chemicals detected at concentrations exceeding the SSLs for migration from soil to groundwater and RIDEM GA leachability criteria were not retained as COPCs for quantitative evaluation in this HHRA.

There are no USEPA SSLs or RIDEM GA leachability criteria available for tetrabutyltin and tributyltin. The uncertainty associated with the lack of screening criteria for these chemicals is discussed in Section 5.5.1, the Uncertainty Analysis.

#### 5.1.3.3 North Waterfront Groundwater

Seven VOCs and 13 inorganics were detected in groundwater samples collected at the North Waterfront. A comparison of maximum detected groundwater concentrations to screening levels based on RSLs for tap water, USEPA MCLs, and RIDEM GA groundwater objectives is presented in Table 5-8. The following chemicals were detected at maximum concentrations exceeding the COPC screening levels and were retained as COPCs for groundwater at the North Waterfront:

- VOCs (cis-1,2-dichloroethene, TCE, and vinyl chloride).
- Metals (Total) [aluminum, arsenic, chromium, iron, and manganese]
- Metals (Dissolved) [aluminum and manganese].

Concentrations of cis-1,2-dichloroethene and manganese exceeded screening toxicity levels (set at a HI of 0.1) but did not exceed RSLs. TCE and arsenic were the only chemicals detected at a concentration exceeding the RIDEM GA groundwater objectives.

A comparison of maximum detected groundwater VOC concentrations to USEPA screening levels for chemical migration from groundwater through building foundations and into indoor air is presented in Table 5-9. The following chemicals were detected at maximum concentrations exceeding the COPC screening levels and were retained as COPCs for groundwater at the North Waterfront:

VOCs (TCE, and vinyl chloride).

#### 5.1.3.4 North Waterfront Soil Gas

Thirty-five VOCs were detected in soil gas samples collected at the North Waterfront. A comparison of maximum detected soil gas concentrations to USEPA screening levels is presented in Table 5-10. The following chemicals were detected at maximum concentrations exceeding the COPC screening levels and were retained as COPCs for soil gas at the North Waterfront:

VOCs (1,3-butadiene, acrylonitrile, benzene, tetrachloroethene and TCE).

1,3-Butadiene and acrylonitrile were not detected in any surface soil, subsurface soil, or groundwater samples collected at the North Waterfront.

## 5.1.3.5 Central Shipyard Surface Soil

Eighteen SVOCs, 3 pesticides/PCBs, 20 inorganics, and several miscellaneous chemicals were detected in surface soil samples collected at the Central Shipyard. A comparison of maximum detected surface soil concentrations to screening levels based on RSLs and RIDEM DECs for residential exposure is presented in Table 5-11. The following chemicals were detected at maximum concentrations exceeding the direct contact COPC screening levels, and were retained as COPCs for surface soil at the Central Shipyard:

- SVOCs [benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and chrysene].
- Inorganics (arsenic, chromium, cobalt, iron, and manganese).

The maximum detected concentration cobalt, iron, and manganese exceeded screening toxicity levels (set at a HQ of 0.1) but did not exceed RSLs. Concentrations of benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and chromium exceeded the screening criteria based on the RSLs but were less than the RIDEM DECs. Concentrations of chrysene exceeded RIDEM DECs but were less than the screening criteria based on the RSLs. Concentrations of aluminum also exceeded the screening levels but were within naturally occurring levels and are not considered to be site related (Appendix G), therefore aluminum was not retained as a COPC for direct contact with surface soil.

There are no direct contact COPC screening criteria available for carbazole. The uncertainty associated with the lack of screening criteria for carbazole is discussed in Section 5.5.1, the Uncertainty Analysis.

A comparison of the maximum detected surface soil concentrations to USEPA SSLs for chemical migration from soil to groundwater and RIDEM GA leachability criteria is presented in Table 5-12. The following chemicals were detected in surface soil at maximum concentrations exceeding the screening levels for migration from soil to groundwater at Central Shipyard:

- SVOCs [2,2'-oxybis(1-chloropropane), 4-methylphenol, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, and indeno(1,2,3-cd)pyrene].
- Pesticides/PCBs (Aroclor-1260).
- Metals (arsenic, cadmium, chromium, cobalt, copper, iron, manganese, nickel, and selenium).

SVOCs and copper were not detected in groundwater samples collected at the Central Shipyard. Concentrations of all chemicals were less than the RIDEM GA leachability criteria. Concentrations of arsenic in TCLP samples were less than the RIDEM GA leachability criteria. Concentrations of lead and

mercury exceeded the screening levels but were within naturally occurring levels and are not considered to be site related (Appendix G). As discussed in Section 5.1.2.1, chemicals detected at concentrations exceeding the SSLs for migration from soil to groundwater and RIDEM GA leachability criteria were not retained as COPCs for quantitative evaluation in this HHRA.

There are no USEPA SSLs or RIDEM GA leachability criteria available for carbazole, creosote, tetrabutyltin, and tributyltin. The uncertainty associated with the lack of screening criteria for these chemicals is discussed in Section 5.5.1, the Uncertainty Analysis.

## 5.1.3.6 Central Shipyard Subsurface Soil

Five VOCs, 18 SVOCs, 5 pesticides/PCBs, 20 inorganics, and two miscellaneous chemicals were detected in subsurface soil samples at the Central Shipyard. A comparison of maximum detected subsurface soil concentrations to screening levels based on RSLs and RIDEM DECs for residential exposure is presented in Table 5-13. The following chemicals were detected at maximum concentrations exceeding the direct contact COPC screening levels and were retained as COPCs for subsurface soil at the Central Shipyard:

- SVOCs [benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene].
- Inorganics (aluminum, arsenic, chromium, cobalt, and iron).

Concentrations of dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, and chromium exceeded the screening criteria based on the RSLs but were less than the RIDEM DECs. Concentrations of chrysene exceeded RIDEM DECs, but were less than the screening criteria based on the RSLs. Concentrations of manganese also exceeded the screening levels but were within naturally occurring levels and are not considered to be site related (Appendix G), therefore manganese was not retained as a COPC for direct contact with subsurface soil.

A comparison of maximum detected subsurface soil concentrations to USEPA SSLs for chemical migration from soil to groundwater and RIDEM GA leachability criteria is presented in Table 5-14. The following chemicals were detected in subsurface soil at maximum concentrations exceeding the screening levels for migration from soil to groundwater at the Central Shipyard:

SVOCs [2-methylnaphthalene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, bis(2-ethylhexyl)phthalate, chrysene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, naphthalene].

- Pesticides/PCBs (4,4'-DDD, 4,4'-DDT, total Aroclors)
- Metals (arsenic, cadmium, chromium, cobalt, copper, iron, lead, mercury, nickel, selenium, and silver).

Lead was the only chemical detected at concentrations exceeding the RIDEM GA leachability criteria. SVOCs, copper, mercury, and silver were not detected in groundwater samples collected at the Central Shipyard. Concentrations of manganese also exceeded the screening levels but were within naturally occurring levels and are not considered to be site related (Appendix G). As discussed in Section 5.1.2.1, chemicals detected at concentrations exceeding the SSLs for migration from soil to groundwater and RIDEM GA leachability criteria were not retained as COPCs for quantitative evaluation in this HHRA.

There are no USEPA SSLs or RIDEM GA leachability criteria available for tetrabutyltin and tributyltin. The uncertainty associated with the lack of screening criteria for these chemicals is discussed in Section 5.5.1, the Uncertainty Analysis.

## 5.1.3.7 Central Shipyard Groundwater

Acetone and 16 metals were detected in groundwater samples collected at Central Shipyard. A comparison of maximum detected groundwater concentrations to screening levels based on RSLs for tap water, USEPA MCLs, and RIDEM GA groundwater objectives is presented in Table 5-15. The following chemicals were detected at maximum concentrations exceeding the COPC screening levels and were retained as COPCs for groundwater at the Central Shipyard:

- Metals (Total) (aluminum, arsenic, cadmium, chromium, cobalt, iron, and manganese).
- Metals (Dissolved) (arsenic, cadmium, cobalt, iron, and manganese).

Concentrations of all chemicals with the exception of arsenic were less than the RIDEM GA groundwater objectives.

A comparison of maximum detected groundwater VOC concentrations to USEPA screening levels for chemical migration from groundwater through building foundations and into indoor air is presented in Table 5-16. Concentrations of all chemicals were less than the associated screening levels.

## 5.1.3.8 Former Building 234 Surface Soil

Two VOCs, 18 SVOCs, 6 pesticides/PCBs, 20 inorganics, and 2 miscellaneous chemicals were detected in surface soil samples collected at former Building 234. A comparison of maximum detected surface soil concentrations to screening levels based on RSLs and RIDEM DECs for residential exposure is presented in Table 5-17. The following chemicals were detected at maximum concentrations exceeding the direct contact COPC screening levels and were retained as COPCs for surface soil at former Building 234:

- SVOCs [benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene].
- Inorganics (arsenic, beryllium, cadmium, chromium, cobalt, iron, lead, and manganese).

The maximum detected concentrations of cadmium, iron, and manganese exceeded screening toxicity levels (set at a HQ of 0.1), but did not exceed RSLs. Concentrations of benzo(a)anthracene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene, cadmium, and chromium exceeded the screening criteria based on the RSLs, but were less than the RIDEM DECs. Concentrations of chrysene, beryllium, and lead exceeded RIDEM DECs, but were less than the screening criteria based on the RSLs. Concentrations of aluminum also exceeded the screening levels but were within naturally occurring levels and are not considered to be site related (Appendix G), therefore aluminum was not retained as COPCs for direct contact with surface soil.

There are no COPC screening criteria available for carbazole and creosote. The uncertainty associated with the lack of screening criteria for carbazole and creosote is discussed in Section 5.5.1, the Uncertainty Analysis.

A comparison of the maximum detected surface soil concentrations to USEPA SSLs for chemical migration from soil to groundwater and RIDEM GA leachability criteria is presented in Table 5-18. The following chemicals were detected in surface soil at maximum concentrations exceeding the screening levels for migration from soil to groundwater at former Building 234:

- SVOCs [benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, bis(2-ethylhexyl)phthalate, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene].
- Pesticides/PCBs (Aroclor-1254, gamma-chlordane, and heptachlor).

 Metals (arsenic, barium, cadmium, chromium, cobalt, copper, iron, lead, manganese, nickel, selenium, and zinc).

Selenium was not detected in groundwater samples collected at former Building 234. Lead was the only chemical detected at concentrations exceeding the RIDEM GA leachability criteria. As discussed in Section 5.1.2.1, chemicals detected at concentrations exceeding the SSLs for migration from soil to groundwater and RIDEM GA leachability criteria were not retained as COPCs for quantitative evaluation in this HHRA.

There are no USEPA SSLs or RIDEM GA leachability criteria available for carbazole, creosote, di-n-octyl phthalate, tetrabutyltin, and tributyltin. The uncertainty associated with the lack of screening criteria for these chemicals is discussed in Section 5.5.1, the Uncertainty Analysis.

#### 5.1.3.9 Former Building 234 Subsurface Soil

Six VOCs, 16 SVOCs, heptachlor, 21 inorganics, and tetrabutyltin were detected in subsurface soil samples at the Former Building 234. A comparison of maximum detected subsurface soil concentrations to screening levels based on RSLs and RIDEM DECs for residential exposure is presented in Table 5-19. The following chemicals were detected at maximum concentrations exceeding the direct contact COPC screening levels and were retained as COPCs for subsurface soil at former Building 234:

- SVOCs [benzo(a)pyrene].
- Inorganics (aluminum, arsenic, chromium, cobalt, and iron).

Concentrations of benzo(a)pyrene and chromium exceeded the screening criteria based on the RSLs, but were less than the RIDEM DECs. Concentrations of manganese also exceeded the screening levels but were within naturally occurring levels and are not considered to be site related (Appendix G), therefore manganese was not retained as a COPC for direct contact with subsurface soil.

A comparison of maximum detected subsurface soil concentrations to USEPA SSLs for chemical migration from soil to groundwater and RIDEM GA leachability criteria is presented in Table 5-20. The following chemicals were detected in subsurface soil at maximum concentrations exceeding the screening levels for migration from soil to groundwater at former Building 234:

VOCs (benzene, ethylbenzene, and TCE)

- SVOCs [2-methylnaphthalene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, bis(2ethylhexyl)phthalate, naphthalene]
- Pesticides/PCBs (heptachlor)
- Metals (aluminum, arsenic, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, nickel, selenium, and silver)

Naphthalene was the only chemical detected at concentrations exceeding the RIDEM leachability criteria. Of these chemicals, only TCE, arsenic, and nickel were detected in groundwater samples collected at former Building 234. As discussed in Section 5.1.2.1, chemicals detected at concentrations exceeding the SSLs for migration from soil to groundwater and RIDEM GA leachability criteria were not retained as COPCs for quantitative evaluation in this HHRA.

There are no USEPA SSLs or RIDEM GA leachability criteria available for creosote and tetrabutyltin. The uncertainty associated with the lack of screening criteria for creosote and tetrabutyltin is discussed in Section 5.5.1, the Uncertainty Analysis.

## 5.1.3.10 Former Building 234 Groundwater

Six VOCs and 16 metals were detected in groundwater samples collected at former Building 234. A comparison of maximum detected groundwater concentrations to screening levels based on RSLs for tap water, USEPA MCLs, and RIDEM GA groundwater objectives is presented in Table 5-21. The following chemicals were detected at maximum concentrations exceeding the COPC screening levels and were retained as COPCs for groundwater at former Building 234:

- VOCs (cis-1,2-dichloroethene, TCE, and vinyl chloride)
- Metals (Total) (aluminum, arsenic, chromium, cobalt, iron, and manganese)
- Metals (Dissolved) (arsenic, cobalt, iron, and manganese)

The maximum detected concentrations of cis-1,2-dichloroethene, cobalt (total and dissolved), iron (total), and manganese (dissolved) exceeded screening toxicity levels (set at a HQ of 0.1), but did not exceed RSLs. Vinyl chloride and arsenic were the only chemicals detected at a concentration exceeding the RIDEM GA groundwater objectives.

A comparison of maximum detected groundwater VOC concentrations to USEPA screening levels for chemical migration from groundwater through building foundations and into indoor air is presented in

Table 5-22. The following chemicals were detected at maximum concentrations exceeding the COPC screening levels and were retained as COPCs for groundwater at former Building 234:

VOCs (TCE and vinyl chloride)

#### 5.1.3.11 South Waterfront Subsurface Soil

Three PAHs and 18 inorganics were detected in subsurface soil at the South Waterfront. A comparison of maximum detected subsurface soil concentrations to screening levels based on the RSLs and RIDEM DECs for residential exposure is presented in Table 5-23. The following chemicals were detected at maximum concentrations exceeding direct contact COPC screening levels and were retained as COPCs for subsurface soil at the South Waterfront:

Inorganics (aluminum, arsenic, chromium, cobalt, and iron)

Concentrations of manganese also exceeded the screening levels but were within naturally occurring levels and are not considered to be site related (Appendix G), therefore manganese was not retained as a COPC for direct contact with subsurface soil.

A comparison of maximum detected subsurface soil concentrations to USEPA SSLs for chemical migration from soil to groundwater and RIDEM GA leachability criteria is presented in Table 5-24. The following chemicals were detected in subsurface soil at maximum concentrations exceeding the screening levels for migration from soil to groundwater at the South Waterfront:

- PAHs [benzo(b)fluoranthene]
- Metals (arsenic, cadmium, chromium, cobalt, copper, iron, lead, and nickel)

Concentrations of all chemicals were less than the RIDEM GA leachability criteria. As discussed in Section 5.1.2.1, chemicals detected at concentrations exceeding the SSLs for migration from soil to groundwater and RIDEM GA leachability criteria were not retained as COPCs for quantitative evaluation in this HHRA.

#### 5.1.3.12 PCB Removal Area Surface Soil

Seventeen PAHs, Aroclor-1260, and 20 inorganics were detected in surface soil samples collected at the PCB removal area. A comparison of maximum detected surface soil concentrations to screening levels

based on RSLs and RIDEM DECs for residential exposure is presented in Table 5-25. The following chemicals were detected at maximum concentrations exceeding the direct contact risk-based COPC screening levels and were retained as COPCs for surface soil at the PCB removal area:

- PAHs [benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(g,h,i)perylene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene]
- PCBs (Aroclor-1260, Total Aroclors)
- Inorganics (arsenic, cobalt, iron, and manganese)

The maximum detected concentration of manganese exceeded screening toxicity levels (set at a HQ of 0.1) but did not exceed RSLs. Concentrations of total Aroclors exceeded the screening criteria based on the RSLs but were less than the RIDEM DECs. Concentrations of benzo(g,h,i)perylene and chrysene exceeded RIDEM DECs but were less than the screening criteria based on the RSLs. Concentrations of aluminum and chromium also exceeded the screening levels but were within naturally occurring levels and are not considered to be site related (Appendix G), therefore these chemicals were not retained as COPCs for direct contact with surface soil.

A comparison of the maximum detected surface soil concentrations to USEPA SSLs for chemical migration from soil to groundwater and RIDEM GA leachability criteria is presented in Table 5-26. The following chemicals were detected in surface soil at maximum concentrations exceeding the screening levels for migration from soil to groundwater at PCB removal area:

- PAHs [2-methylnaphthalene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, indeno(1,2,3-cd)pyrene, naphthalene, phenanthrene, and pyrene]
- PCBs (Aroclor-1260 and total Aroclors)
- Metals (arsenic, cadmium, cobalt, copper, iron, lead, manganese, nickel, and selenium).

Concentrations of all chemicals were less than the RIDEM GA leachability criteria when available. Concentrations of chromium also exceeded the screening levels, but were within naturally occurring levels and are not considered to be site related (Appendix G). As discussed in Section 5.1.2.1, chemicals detected at concentrations exceeding the SSLs for migration from soil to groundwater and RIDEM GA leachability criteria were not retained as COPCs for quantitative evaluation in this HHRA.

#### 5.1.3.13 PCB Removal Area Subsurface Soil

Seventeen PAHs, total Aroclors, and 21 metals were detected in subsurface soil samples at the PCB Removal area. A comparison of maximum detected subsurface soil concentrations to screening levels based on RSLs and RIDEM DECs for residential exposure is presented in Table 5-27. The following chemicals were detected at maximum concentrations exceeding the direct contact risk-based COPC screening levels and were retained as COPCs for subsurface soil at the PCB removal area:

- PAHs [benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene]
- Inorganics (aluminum, arsenic, chromium, cobalt, iron, and manganese)

The maximum detected concentrations of aluminum, iron, and manganese exceeded screening toxicity levels (set at a HQ of 0.1) but did not exceed RSLs. Concentrations of benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, and chromium exceeded the screening criteria based on the RSLs, but were less than the RIDEM DECs.

A comparison of maximum detected subsurface soil concentrations to USEPA SSLs for chemical migration from soil to groundwater and RIDEM GA leachability criteria is presented in Table 5-28. The following chemicals were detected in subsurface soil at maximum concentrations exceeding the screening levels for migration from soil to groundwater at the PCB removal area:

- PAHs [2-mehtylnaphthalene, benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenzo(a,h)anthracene, naphthalene]
- PCBs (Total Aroclors)
- Metals (antimony, arsenic, cadmium, chromium, cobalt, copper, iron, lead, manganese, mercury, nickel, selenium, and zinc)

Concentrations of all chemicals were less than the RIDEM GA leachability criteria when available. As discussed in Section 5.1.2.1, chemicals detected at concentrations exceeding the SSLs for migration from soil to groundwater and RIDEM GA leachability criteria were not retained as COPCs for quantitative evaluation in this HHRA.

#### 5.1.3.14 Summary

Table 5-29 summarizes the chemicals retained as COPCs for direct contact exposures to surface soil, subsurface soil, groundwater, and soil gas at the North Waterfront, Central Shipyard, former Building 234,

South Waterfront, and PCB removal area. RAGS Part D tables for COPC selection are included in Appendix F.2.

#### 5.2 EXPOSURE ASSESSMENT

The exposure assessment portion of the risk assessment defines and evaluates, quantitatively or qualitatively, the type and magnitude of human exposure to the chemicals present at or migrating from a site. The exposure assessment is designed to depict the physical setting of the site, to identify potentially exposed populations and applicable exposure pathways, to calculate concentrations of COPCs to which receptors might be exposed, and to estimate chemical intakes under the identified exposure scenarios.

Actual or potential exposures at the Site were determined based on the most likely pathways of contaminant release and transport, as well as human activity patterns. A complete exposure pathway has three components: a source of chemicals that can be released to the environment, a route of contaminant transport through an environmental medium, and an exposure or contact point for a human receptor.

## 5.2.1 <u>Conceptual Site Model</u>

A conceptual site model (CSM) facilitates consistent and comprehensive evaluation of potential risks to human health by creating a framework for identifying the pathways by which human receptors may come in contact with environmental media contaminated by site activities. A CSM depicts the relationships among the following elements, which are necessary for defining complete exposure pathways:

- Site sources of contamination
- Contaminant release mechanisms and transport/migration pathways
- Exposure routes
- Potential receptors

The elements of the CSM (contaminant source, release mechanisms, transport/migration pathways, exposure routes, and potential receptors) establish the manner and degree to which a potential receptor may be exposed to chemicals present at the site. The degree of risk incurred by a potential receptor varies according to the means of exposure, the duration of exposure, and the specific chemical to which the receptor is exposed.

Section 1 and 2 of this document presented a detailed discussion on site location, site description, and site history for the five subareas of the Site. This section summarizes the information previously presented in Section 2.0 as it applies to the HHRA. Sources of contamination, contaminant release mechanisms, transport and migration pathways, exposure routes, and potential receptors are defined. Table 5-30 provides a site-specific summary of the potential receptors evaluated for the Site. A summary of the exposure routes addressed quantitatively for each human receptor is provided in Table 5-31. Figure 5-1 illustrates the CSM for the Site.

## 5.2.1.1 Site Sources of Environmental Contamination

Summarizing from the Site history information presented in Section 1, the Site was leased by the Navy to the Rhode Island Port Authority who in turned leased the property to the Derecktor Shipyard. The Derecktor Shipyard operated from 1979 to January 1992. The Site was used by Derecktor to repair, maintain, and construct private and military ships. Repair, maintenance, and construction operations were concentrated in the Building 234 area. These operations consisted of sand blasting, painting, hull inspections, and other on-board ship repairs.

Derecktor also constructed new ships under contract to the USCG and U.S. Army. These ships were steel-structured, such as cutters and tugboats, built from the keel up, and outfitted for initial sea trials. Construction included cutting and welding steel, sand blasting, priming and painting the structure, and final ship assembly, which was completed primarily in Building 234. Supporting the ship maintenance and construction operations was an engineering department, a machine shop, an electrical shop, a pipe shop, and a vehicle maintenance shop.

#### 5.2.1.2 Potential Contaminant Release Mechanisms and Transport/Migration Pathways

The soil and groundwater data collected at the Site indicate that past activities have released contaminants to the surrounding environment. Once chemicals have been released to an environmental medium (e.g., soil), they may migrate within that medium, or migrate to another environmental medium (e.g., air). This section summarizes potential containment release mechanisms and transport pathways.

Contaminants in surface soil could migrate to air through wind erosion or through volatile emissions. Subsurface soil is not currently exposed at the site; however, if future construction occurs and brings subsurface soil to the surface, contaminants in subsurface soil could be transported into the air through wind erosion or through volatile emissions (fugitive dusts) may then be deposited off site if the grain size is small enough and the wind speed is great enough. Additionally, contaminants may be released from soil

by volatilization if present at significant concentrations. However, portions of the Site are paved which significantly limits the potential for airborne emissions from the Site.

Contaminants can also migrate from both surface and subsurface soil to groundwater through leaching of chemicals in the soil. The groundwater underlying the Site is primarily recharged through infiltration of precipitation and subsurface flow from upgradient/adjacent areas. This allows for migration of contaminants downward through the buried wastes/soil column to the shallow groundwater. Shallow groundwater at the site discharges to Narragansett Bay.

#### 5.2.1.3 Potential Current and Future Receptors of Concern and Exposure Pathways

The baseline HHRA prepared for the Site considered receptor exposure under residential and non-residential (e.g., industrial, recreational) land-use scenarios. The following receptors were identified in the previous HHRA (B&RE, January 1997):

- Industrial Worker A plausible receptor under current and future land use. This receptor could be directly exposed to surface soil (incidental ingestion; dermal contact) and airborne particulates and vapors from surface soil (inhalation). Under current land use the industrial worker could only be exposed to surface soil in the unpaved areas of the Site. Under future land use the industrial worker could be exposed to all surface soil if the pavement at the Site was removed. Figure 1-2 shows the unpaved and paved areas. If groundwater was used as a drinking water supply then the industrial worker could be exposed to groundwater (ingestion; dermal contact). Industrial worker exposure to subsurface soil is unlikely; however, because future construction could potentially bring subsurface soil to the surface, exposure to subsurface soil via incidental ingestion, dermal contact, and inhalation was evaluated for this receptor to aid in risk management decisions. If this receptor worked in a hypothetical on-site structure, it is also plausible that this receptor could be exposed to VOCs migrating from contaminated subsurface soil or groundwater to the indoor air of a building.
- Construction Workers A plausible on-site receptor under current and future land use. Construction workers could be exposed to surface and subsurface soils (incidental ingestion; dermal contact), shallow groundwater (dermal contact), as well as airborne contaminants emanating from these media (inhalation). It should be noted that significant exposure to groundwater by a construction worker is unlikely because if a construction worker were to have prolonged contact with groundwater then he/she would most likely wear protective clothing such as rubber boots and/or hip waders, which would limit the receptor's exposure. In addition, most excavation activities would utilize construction equipment such as a back hoe, which would limit a construction worker's exposure. Also, if significant groundwater was encountered during an excavation of a trench or

foundation, the groundwater would most likely be pumped out of the excavation so that the construction activities could be completed.

- Adolescent and Adult Trespassers A plausible receptor under current and future land use. Trespassers are individuals using the site for passive activities including walking or hiking two days a week during the warmer months of the year (mid-April through mid-October). A trespasser may be exposed to potentially contaminated surface soil (incidental ingestion; dermal contact), air (inhalation). Under current land use trespassers could only be exposed to surface soil in the unpaved areas of the Site. Under future land use trespassers could be exposed to all surface soil if the pavement at the Site was removed. Trespasser exposure to subsurface soil is unlikely; however, because future construction could potentially bring subsurface soil to the surface, exposure to subsurface soil via incidental ingestion, dermal contact, and inhalation was evaluated for this receptor to aid in risk management decisions. Direct contact with groundwater is not anticipated for this receptor.
- Hypothetical Child and Adult Residents Given the anticipated future land use for much of the Site (commercial/industrial), residents are a very unlikely future receptor. However, the hypothetical future residential scenario is typically evaluated in a risk assessment for decision-making purposes. For example, the need for deed restrictions at a site may be eliminated prior to site closure if minimal risks are estimated for residential receptors. It is assumed that a hypothetical resident may be exposed to surface soil (ingestion; dermal contact, inhalation), groundwater (ingestion; dermal contact, inhalation), and air (inhalation). Also, hypothetical residents could be exposed to VOCs migrating from contaminated subsurface soil or groundwater to the indoor air of a home. Receptor exposure to subsurface soil would only occur if subsurface soil was excavated and deposited on existing surface soil. Although this is an unlikely scenario, it is included in this HHRA for purposes of completeness and to assist the risk managers regarding the need for deed restrictions.

## 5.2.2 <u>Exposure Point Concentrations</u>

The exposure point concentration (EPC), which is calculated for COPCs only (both site related and non-site related [i.e., naturally occurring/non-site-related anthropogenic chemicals]), is an estimate of the chemical concentration within an exposure unit (EU). The EPC is assumed to be the concentration to which the receptor is exposed and is used to estimate exposure intakes. An EU is the area over which receptor activity is expected to occur. The following paragraphs discuss the EUs evaluated in this HHRA and the guidelines for calculating EPCs.

As previously discussed, the North Waterfront, Central Shipyard, former Building 234, South Waterfront, and PCB Removal area were evaluated as separate EUs (Figure 1-2). EPCs were calculated for surface

soil (0 - 2 ft bgs), subsurface soil (> 2 ft bgs), and groundwater. Soils were differentiated from surface and subsurface in anticipation of any future removal actions which would target the surface soil interval.

The following guidelines were used to calculate EPCs:

- For surface soil and subsurface soil the 95-percent upper confidence limit (UCL) on the arithmetic mean, which was based on the distribution of the data set, was selected as the EPC. EPCs were calculated following USEPA's Calculating Upper Confidence Limits for Exposure Point Concentrations at Hazardous Waste Sites (December 2002) and using USEPA's ProUCL software Version 4.1.01. If ProUCL was unable to calculate an UCL then the maximum detected concentration was used as the EPC. The uncertainty associated with using the maximum detected concentration as the EPC is discussed in the uncertainty analysis in Section 5.2.2.
- Two EPCs were calculated for surface soil. The first EPC was calculated using only surface soil samples for the unpaved areas in each EU. This EPC was used to evaluate exposures to surface soil for all receptors with the exception of construction workers under the current land use scenario. The second EPC was calculated assuming the pavement was removed at each EU and therefore the receptors could be exposed to all surface soil. Figure 1-2 shows the unpaved and paved areas. The second EPC was used to evaluate surface soil under future land use. The second EPC was also used to evaluate exposures to construction workers under the current land use scenario. Appendix F.1 identifies the samples for the paved and unpaved areas. Benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene were identified as COPCs in surface soil at the Central Shipyard. COPCs were selected using all surface soil samples for the paved and unpaved area. Benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and dibenzo(a,h)anthracene were not detected in surface soil samples from the unpaved areas in the Central Shipyard, therefore these chemicals were not evaluated in this HHRA.
- The groundwater samples were collected in 1996 and 2011. All groundwater samples were used to identify COPCs for groundwater, but only the 2011 groundwater samples were used to evaluate potential exposures to groundwater since this data is representative of the current conditions at the Site. There were not enough groundwater samples available to calculate an UCL therefore the maximum detected concentration in the 2011 groundwater samples was used as the EPC for groundwater. Appendix F.1 lists the samples which were used to derive the EPCs for groundwater. Arsenic was identified as a COPC in groundwater at the North Waterfront and chromium was identified as a COPC in groundwater at the Central Shipyard and Former Building 234. These compounds were detected in groundwater samples collected in 1996 but were not detected in the latest groundwater samples collected in 2011. Therefore, exposures to arsenic in groundwater at the

North Waterfront and chromium in groundwater at the Central Shipyard and Former Building 234 were not evaluated in this HHRA.

- Non-detected values were evaluated in accordance with the ProUCL guidance. Duplicates were averaged for purposes of calculating EPCs for COPCs in environmental media. In calculating the averages, if one sample was detected and the other was non-detected then the average was calculated using the detected value and one half the non-detected value.
- As stated in the guidance manual for the Integrated Exposure Uptake Biokinetic (IEUBK) model (USEPA, 1994) the arithmetic mean concentration will be used as the EPC for lead.
- The same EPCs were used to evaluate both reasonable maximum exposure (RME) and central tendency exposure (CTE) scenarios.

Table 5-32 summarizes the EPCs used in this HHRA. ProUCL Outputs are included in Appendix F.3. RAGS Part D Tables for the EPCs are presented in Appendix F.2. Appendix F.1 lists the samples which were used to derive the EPCs for soil and groundwater.

## 5.2.3 Chemical Intake Estimation

The methodologies and techniques used to estimate exposure intakes are presented in this section. Intakes for the identified potential receptor groups were calculated using current USEPA risk assessment guidance and are presented in the risk assessment spreadsheets. Risk assessment results are presented using USEPA RAGS Part D table format. Assumptions regarding exposure are presented in Table 5-33. The exposure assumptions presented in Table 5-33 are based on current USEPA and RIDEM risk assessment guidance and are the same as those used in the HHRAs for Site 8 (NUSC) (Tetra Tech, January 2010) and Tank Farm 4 and 5 (Tetra Tech, January 2011) at NAVSTA Newport.

Non-carcinogenic intakes were estimated using the concept of an average annual exposure. Carcinogenic intakes were calculated as incremental lifetime exposures, which assume a life expectancy of 70 years. The exposure assumptions reflect current USEPA guidance. The majority of the exposure assumptions used to estimate chemical intakes were based on default assumptions described in several USEPA guidance documents (e.g., USEPA December 1989, March 1991, August 1997, and July 2004) and RIDEM guidance (February 2004). The RIDEM guidance only contains exposure assumptions for industrial workers and residents exposed to soil via incidental ingestion and inhalation routes of exposure. RIDEM does not have default exposure assumptions for construction workers, trespassers, or recreational users. The following paragraphs discuss the non-default receptor-specific exposure assumptions used in the risk assessment.

## 5.2.3.1 Incidental Ingestion of Soil

Direct physical contact with soil may result in the incidental ingestion of chemicals. Chemical intake for the incidental ingestion of soil is estimated in the following manner (USEPA, December 1989):

Intake = 
$$\frac{(C_s)(IR)(FI)(EF)(ED)(CF)}{(BW)(AT)}$$

where:

Intake = intake of chemical from soil (mg/kg/day)

C<sub>s</sub> = concentration of chemical in soil (mg/kg)

IR = ingestion rate (mg/day)

FI = fraction ingested from contaminated source (dimensionless)

EF = exposure frequency (days/year [yr])

ED = exposure duration (yr)

CF = conversion factor  $(1 \times 10^{-6} \text{ kg/mg})$ 

BW = body weight (kg)

AT = averaging time (days);

for non-carcinogens,  $AT = ED \times 365 \text{ days/yr}$ 

for carcinogens, AT = 70 yr x 365 days/yr

Most of the exposure assumptions used to estimate chemical intakes from incidental ingestion of soil were based on default assumptions described in standard USEPA guidance and are summarized in Table 5-33. The following paragraphs briefly discuss the non-default receptor-specific exposure assumptions for incidental ingestion of soil that were used in the HHRA.

The selected exposure frequency assumptions consider anticipated receptor activities at the Site. It is assumed that construction workers assigned to future excavation projects at the Site are exposed to soil for 5 days a week over 6 months (130 days a year) for 1 year. It is assumed that adolescent and adult trespassers are exposed to soil for 2 days per week over 24 weeks (48 days a year).

#### 5.2.3.2 Dermal Contact with Soil

Direct physical contact with soil may result in the dermal absorption of chemicals. Exposure associated with dermal contact with soil is estimated in the following manner (USEPA, December 1989):

Intake = 
$$\frac{(C_s)(SA)(AF)(ABS)(CF)(EF)(ED)}{(BW)(AT)}$$

where:

Intake = amount of chemical absorbed during contact with soil (mg/kg/day)

C<sub>s</sub> = concentration of chemical in soil (mg/kg)

SA = skin surface area available for contact  $(cm^2/day)$ 

AF = skin adherence factor (mg/cm²)

ABS = absorption factor (dimensionless)

CF = conversion factor (1 x 10<sup>-6</sup> kg/mg)

EF = exposure frequency (days/year)

ED = exposure duration (year)

BW = body weight (kg)

AT = averaging time (days);

for non-carcinogens,  $AT = ED \times 365 \text{ days/year}$  for carcinogens,  $AT = 70 \text{ years } \times 365 \text{ days/year}$ 

Most of the exposure assumptions used to estimate chemical intakes from dermal contact with soil were based on the default assumptions described in standard USEPA guidance and are summarized in Table 5-33. The following paragraphs briefly discuss non-default receptor-specific exposure assumptions for dermal contact with soil that were used in the HHRA.

The exposed skin surface areas of the body available for dermal contact with soil were determined on a receptor-specific basis because they correspond with assumed human activities and clothing worn during exposure events. With the exception of the skin surface area recommended for adolescent trespassers exposed to soil, all of the skin surface areas presented in Table 5-33 are based on USEPA default values. Current guidance (USEPA August 1997 and July 2004) was used to develop the skin surface area available for contact for the adolescent trespasser as follows:

• For the adolescent trespasser, the skin surface area available for soil contact is 5,500 cm<sup>2</sup> (which assumes that the head, forearms, hands, lower legs, and feet are exposed).

A summary of the receptor-specific input values used to estimate chemical intakes from dermal contact with soil are presented in Table 5-33. The same exposure frequencies and durations recommended for the evaluation of incidental ingestion of soil were used to estimate chemical intakes for dermal contact with soil. The soil adherence factors presented are those in Exhibits 3.3 and 3.5 of RAGS Part E.

To the extent possible, chemical-specific dermal absorption factors provided in RAGS Part E were used to evaluate the COPCs for soil. However, dermal absorption factors are only available for the short list of chemicals in Exhibit 3-4 of RAGS Part E. In addition, as indicated in RAGS Part E, absorption factors for metals other than arsenic and cadmium have not been developed due to insufficient data to support default values. Therefore, ABS was set equal to zero for these chemicals and risks from dermal absorption of metals other than arsenic and cadmium from soil were not quantified in this risk assessment. The uncertainty associated with the omission of these constituents is discussed in the uncertainty analysis. Dermal absorption values used in this HHRA are presented in Table 5-34.

### 5.2.3.3 Inhalation of Air Containing Fugitive Dust/Volatiles Emitted from Soil

Intakes of both particulates and vapors/gases are calculated using the same equation, as follows (USEPA, January 2009):

$$EC = \frac{(C_{air})(ET)(EF)(ED)}{AT \times 24 \text{ hrs/day}}$$

where:

EC = exposure concentration (mg/m<sup>3</sup>)

 $C_{air}$  = concentration of chemical in air (mg/m<sup>3</sup>)

ET = exposure time (hours/day)

EF = exposure frequency (days/yr)

ED = exposure duration (yr)

AT = averaging time (hours);

= for non-carcinogens, AT = ED x 365 days/yr

= for carcinogens, AT = 70 yr x 365 days/yr

Some of the exposure assumptions used to estimate chemical intakes from inhalation of fugitive dusts/volatile emissions from surface and subsurface soil were based on default assumptions described in standard USEPA guidance and are summarized in Table 5-33. The same exposure frequencies and durations used to estimate incidental ingestion of soil intakes were used to estimate exposure via inhalation of fugitive dust/volatile emissions for surface and subsurface soil.

The concentrations of chemicals in air resulting from emissions from soil are developed following procedures presented in USEPA Soil Screening Guidance (December 2002). Chemical concentrations in air were calculated as follows:

$$C_{air} = C_{soil} \times \left[ \frac{1}{PEF} + \frac{1}{VF} \right]$$

where:

 $C_{air}$  = chemical concentration in air (mg/m³)  $C_s$  = chemical concentration in soil (mg/kg) PEF = Particulate emission factor (m³/kg)

VF = volatilization factor (m<sup>3</sup>/kg)

No volatile chemicals were retained as COPCs in surface and subsurface soil, therefore the above equation reduces to:

$$C_{air} = C_{soil} \times \left[ \frac{1}{PEF} \right]$$

The particulate emissions factor (PEF) relates the concentration of the chemical in soil to the concentration of dust particles in air. A PEF value of 1.1 x 10<sup>+10</sup> m<sup>3</sup>/kg was obtained from USEPA's Soil Screening internet site at http://rais.ornl.gov/epa/ssl1.shtml. This is the default value for Hartford, Connecticut, which is the closest city to the Site listed on the Internet site. Because air emissions resulting from fugitive dust emissions settings will be different than dust emissions generated during construction activities, a separate PEF was used for construction activities. The PEF for construction workers (1.4x10<sup>+6</sup> m<sup>3</sup>/kg) was calculated using the equations presented in the supplemental SSL guidance document (USEPA, December 2002). Sample calculations showing how the PEFs were calculated are presented in Appendix F.4.

### 5.2.3.4 Ingestion of Groundwater

Ingestion of groundwater is expected to be limited to exposure that would occur under a future construction, industrial, and residential scenario. Intakes associated with ingestion of groundwater were evaluated using the following equation (USEPA, December 1989):

Intake = 
$$\frac{(C_w)(IR_w)(EF)(ED)}{(BW)(AT)}$$

where:

Intake = intake of chemical from groundwater (mg/kg/day)

C<sub>w</sub> = concentration of chemical in groundwater (mg/L)

 $IR_w$  = ingestion rate for groundwater (L/day)

EF = exposure frequency (days/yr)

ED = exposure duration (yr)

BW = body weight (kg)

AT = averaging time (days);

for non-carcinogens, AT = ED x 365 days/yr for carcinogens, AT = 70 yrs x 365 days/yr

USEPA standard default exposure assumptions were used to evaluate residential exposures to groundwater. The following paragraphs briefly discuss non-default receptor-specific exposure assumptions for ingestion of groundwater that were used in the HHRA.

Groundwater ingestions rates used in the previous HHRA (B&RE, January 1997) were used for the construction worker (0.05 L/hr) and industrial worker (1 L/day).

A summary of the receptor-specific input values used to estimate chemical intakes from ingestion of groundwater are presented in Table 5-33.

#### 5.2.3.5 Dermal Contact with Groundwater

Hypothetical future residential receptors were assumed to use groundwater for domestic purposes (e.g., bathing, showering, and dish washing) that can result in dermal exposure. Short-term dermal exposure was assumed to occur for the construction worker during excavation activities. Also future industrial could have contact with groundwater if groundwater was used as a potable water supply at the site. The following equation was used to assess exposures resulting from dermal contact with groundwater (USEPA, July 2004):

$$DAD = \frac{(DA_{event})(EV)(ED)(EF)(SA)}{(BW)(AT)}$$

where:

DAD = dermally absorbed dose of chemical from water (mg/kg/day)

 $DA_{event}$  = dermally absorbed dose per event (mg/cm<sup>2</sup>-event)

EV = event frequency (events/day)

ED = exposure duration (yr)

EF = exposure frequency (days/yr)

SA = skin surface area available for contact (cm<sup>2</sup>)

BW = body weight (kg)

AT = averaging time (days);

for non-carcinogens, AT = ED x 365 days/yr

for carcinogens, AT = 70 yrs x 365 days/yr

Most of the exposure assumptions used to estimate chemical intakes from dermal contact with groundwater were based on default assumptions described in standard USEPA guidance and are summarized in Table 5-33.

Dermal intakes for residents assumed total body exposure on a daily basis. For construction workers the exposed surface area of the body available for contact was based on assumed activities and was similar to the assumptions outlined for dermal contact with soil. It is assumed industrial workers only wash their hands and do not bathe or shower while at work. A value of 904 cm (assume hands are exposed) was used for the skin area available for contact by industrial workers.

The absorbed dose per event (DA<sub>event</sub>) was estimated using a non-steady-state approach for organic compounds and a traditional steady-state approach for inorganics. For organics, the following equations apply:

$$\begin{split} &\text{If } t_{\text{event}} < t^{\text{`}}, \text{ then : DA}_{\text{event}} = (2)(K_{\text{p}})(FA)(C_{\text{W}})(CF) \Bigg( \sqrt{\frac{6\,\tau\,t_{\text{event}}}{\pi}} \Bigg) \\ &\text{If } t_{\text{event}} > t^{\text{`}}, \text{ then : DA}_{\text{event}} = (K_{\text{p}})(FA)(C_{\text{W}})(CF) \Bigg( \frac{t_{\text{event}}}{1+B} + 2\,\tau \Bigg( \frac{1+3B+3B^2}{(1+B)^2} \Bigg) \Bigg) \end{split}$$

where:

 $t_{event}$  = duration of event (hour/event)

t\* = time to reach steady-state conditions (hour)

K<sub>p</sub> = permeability coefficient from water through skin (cm/hour)

FA = chemical-specific fraction absorbed (dimensionless)

C<sub>w</sub> = concentration of chemical in water (mg/L)

 $\tau$  = lag time (hour)

 $\pi$  = Pi (dimensionless; equal to 3.1416)

CF = conversion factor (0.001 L/cm<sup>3</sup>)

B = Dimensionless ratio of the permeability of the stratum corneum relative to

the permeability across the viable epidermis (dimensionless)

Values for the chemical-specific parameters (t\*,  $K_p$ , FA,  $\tau$ , and B) were obtained from the current dermal guidance (USEPA, July 2004, Exhibit B-3) and are presented in Table 5-34. If published values were not available for a particular compound, they were calculated using equations provided in the USEPA dermal guidance. While the dermal guidance provides chemical specific values for PAHs the guidance also recommends that dermal absorption of PAHs in groundwater not be evaluated quantitatively in a HHRA

Section 5 Addendum 1 FINAL

because such evaluations are outside of the effective predictive domain of the model. Therefore, no chemical-specific parameters are included in Table 5-34 for PAHs and dermal exposures to PAHs and in water were not evaluated in this HHRA.

The following steady-state equation was used to estimate DA<sub>event</sub> for inorganics:

$$DA_{event} = (K_p)(C_W)(t_{event})$$

The dermal permeability coefficient (K<sub>p</sub>) values recommended in the USEPA dermal guidance (USEPA, July 2004) were used to calculate DA<sub>event</sub> for inorganic COPCs.

#### 5.2.3.6 Inhalation of Volatiles in Groundwater

Groundwater exposure may also result in chemical intake through inhalation if the water resource is used as a domestic water supply or is exposed during construction activities and VOCs are present in the groundwater. This exposure route is plausible for residential receptors who may be exposed while showering, bathing, washing dishes, etc. and for construction workers contacting shallow groundwater during excavation activities. Chemical intakes from inhalation exposure due to the volatilization of COPCs in groundwater were estimated in the following manner (USEPA, January 2009):

$$EC = \frac{(C_{air})(ET)(EF)(ED)}{AT \times 24 \text{ hrs/day}}$$

where:

EC = exposure concentration (mg/m<sup>3</sup>)

 $C_{air}$  = concentration of chemical in air (mg/m<sup>3</sup>)

ET = exposure time (hours/day)

EF = exposure frequency (days/yr)

ED = exposure duration (yr)

AT = averaging time (days)

= for non-carcinogens, AT = ED x 365 days/yr

= for carcinogens, AT = 70 yr x 365 days/yr

For hypothetical child and adult residents, the chemical concentration in air resulting from the volatilization of COPCs during domestic groundwater use is calculated by using the following equation (USEPA, March 1991):

SASE Addendum On-Shore Derecktor Shipyard January 2013 Section 5 Addendum 1 FINAL

$$C_{air} = (C_{gw})(K)$$

where:

 $C_{air}$  = chemical concentration in indoor air, mg/m<sup>3</sup>

C<sub>gw</sub> = chemical concentration in groundwater, mg/L

K = Volatilization Factor, L/m<sup>3</sup>

The same exposure frequencies and exposure durations used to estimate intake for dermal contact with groundwater are used to evaluate chemical intakes for inhalation of VOCs from domestic use of groundwater.

Construction workers may be exposed to COPCs that have volatilized from groundwater when excavation exposes the shallow water table. The same exposure frequency and exposure time used to estimate intake from dermal contact with groundwater were used to evaluate intake from inhalation of VOCs from groundwater during construction activities.

There are no well-established models available for estimating migration of volatiles from groundwater into a construction/utility trench. To estimate EPCs for air in a construction trench, the HHRA used an approach suggested by the Virginia Department of Environmental Quality (VDEQ, September 2012) that is based on a combination of a vadose zone model (to estimate volatilization of gases from contaminated groundwater into a trench) and a box model (to estimate dispersion of the contaminants from the air inside the trench into the above-ground atmosphere). The VDEQ methodology is described in the following paragraphs.

The airborne concentration of a contaminant in a trench can be estimated using the following equation:

$$C_{air} = C_{GW} \times VF$$

where:

 $C_{air}$  = air concentration of contaminant in the trench ( $\mu$ g/m<sup>3</sup>)

 $C_{GW}$  = concentration of contaminant in groundwater ( $\mu$ g/L)

VF = volatilization factor  $(L/m^3)$ 

It was assumed that a construction project at the Site could result in an excavation of 15 ft bgs or less. If the depth to groundwater at a site is less than 15 feet, the VDEQ model assumes that a worker would encounter groundwater when digging an excavation or a trench. The worker would then have direct

W5211766F 5-35 CTO WE20

exposure to the groundwater. The worker would also be exposed to contaminants in the air inside the trench that would result from volatilization from the groundwater pooling at the bottom of the trench.

The following equation was used to calculate the VF for a trench less than 15 ft deep:

$$VF = (Ki \times A \times F \times 10^{-3} \times 10^{4} \times 3,600) / (ACH \times V)$$

where:

Ki = overall mass transfer coefficient of contaminant (cm/s)

A = area of the trench  $(m^2)$ 

F = fraction of floor through which contaminant can enter (unitless)

ACH = air changes per hour  $(h^{-1}) = 360 h^{-1}$ 

V = volume of trench (m<sup>3</sup>)

 $10^{-3}$  = conversion factor (L/cm<sup>3</sup>)

 $10^4$  = conversion factor (cm<sup>2</sup>/m<sup>2</sup>)

3,600 = conversion factor (seconds/hour)

Studies of urban canyons suggest that if the ratio of trench width, relative to wind direction, relative to trench depth is less than or equal to 1, a circulation cell or cells will be set up within the trench that limits the degree of gas exchange with the atmosphere and, based on measured ventilation rates of buildings, the air changes per hour (ACH) is assumed to be two. Based on the ratio of trench depth to average wind speed, if the ratio of trench width to trench depth is greater than 1, the air exchange between the trench and above-ground atmosphere is not restricted, and the ACH is assumed to be 360. The exposure assessment performed for this HHRA assumed that the width-to-trench depth ratio was greater than 1; therefore, the ACH was set at 360.

K<sub>i</sub> was calculated using the following equation:

$$K_i = 1 / \{(1/k_iL) + [(RT) / (H_i k_iG)]\}$$

where:

K<sub>i</sub> = overall mass transfer coefficient of containment (cm/s)

 $k_iL$  = liquid-phase mass transfer coefficient of i (cm/s)

R = ideal gas constant (atm-m<sup>3</sup>/mole- $^{\circ}$ K) = 8.2 x 10<sup>-5</sup>

T = average system absolute temperature (°K) (Default = 298°K)

 $H_i$  = Henry's Law constant of i (atm-m<sup>3</sup>/mole)

k<sub>i</sub>G = gas-phase mass transfer coefficient of i (cm/s)

The formulas for calculating k<sub>i</sub>L and k<sub>i</sub>G are as follows:

$$k_i L = (MWO_2/MW_i)^{0.5} \times (T/298) \times kL_iO_2$$

where:

k<sub>i</sub>L = liquid-phase mass transfer coefficient of component i (cm/s)

 $MWO_2$  = molecular weight of oxygen (g/mole)

MW<sub>i</sub> = molecular weight of component i (g/mole)

kL,O<sub>2</sub> = liquid-phase mass transfer coefficient of oxygen at 25°C (cm/s) =

0002 cm/s

$$k_iG = (MWH_2O/MW_i)^{0.335} \times (T/298)^{1.005} \times kG_1H_2O$$

where:

k<sub>i</sub>G = gas-phase mass transfer coefficient of component i (cm/s)

 $MWH_2O =$  molecular weight of water (g/mole)

kG,H<sub>2</sub>O = gas-phase mass transfer coefficient of water vapor at 25°C (cm/s)=

0.833 cm/s (USEPA, 1988).

Chemical properties were obtained from the Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites (USEPA, December 2002) and are presented in Table 5-35.

### 5.2.3.7 Assessing Cancer Risks from Early Life Exposures

USEPA's Supplemental Guidance of Assessing Susceptibility from Early-Life Exposure to Carcinogens (USEPA, March 2005) recommends making adjustments to the toxicity of carcinogenic chemicals that act via the mutagenic mode of action when evaluating early-life exposures. The guidance recommends using age-dependent adjustment factors (ADAFs) combined with age-specific exposure estimates when assessing cancer risks. In the absence of chemical-specific data, the supplement guidance recommends the following default adjustments, which reflect the fact that cancer risks are generally higher from early-life exposures than from similar exposures later in life:

- For exposures before 2 years of age (i.e., spanning a 2-year interval from the first day of birth until a child's second birthday), a 10-fold adjustment.
- For exposures between 2 and 16 years of age (i.e., spanning a 14-year time interval from a child's second birthday until their sixteenth birthday), a three-fold adjustment.
- For exposures after turning 16 years of age, no adjustment.

Section 5 Addendum 1 FINAL

The adjustments were applied using the same method as that used by ORNL in the development of RSLs. Children were evaluated as two age groups, ages 0 to 2 years and ages 2 to 6 years, and adults were evaluated as two age groups, ages 6 to 16, and ages greater than 16 years old. Using this approach, the intakes for hypothetical residents were calculated as follows:

And the intakes for adolescent trespassers were calculated as follows:

The above approach was used only for those chemicals that are identified as mutagenic in the ORNL screening table (e.g., carcinogenic PAHs, hexavalent chromium). Sample calculations showing how this approach was applied are included in Appendix F.4.

### 5.2.3.8 Summary of Exposure Parameters

A summary of exposure input parameters for all exposure pathways is presented in Table 5-33 for the identified potential receptor groups at the Site. In general, standard default parameters (e.g., USEPA, December 1989, March 1991, July 1997, and July 2004; RIDEM, November 2011), which combine midrange and upper-end exposure factors, were used in this HHRA.

### 5.3 TOXICITY ASSESSMENT

The toxicity assessment weighs the evidence regarding the potential for exposure to chemicals to produce adverse effects in exposed receptors and, when possible, the assessment estimates the relationship between the exposure to a chemical and the increased likelihood and/or severity of adverse effects. Quantitative estimates of the relationship between the magnitude and type of exposures and the severity or probability of human health effects are defined for the identified constituents of concern. Quantitative toxicity values determined during this component of the risk assessment are integrated with exposure assessment outputs to characterize the potential occurrence of adverse health effects for each receptor group.

The reference dose (RfD) is the toxicity value used to evaluate noncarcinogenic health effects for ingestion and dermal exposures. The reference concentration (RfC) is used to evaluate noncarcinogenic

health effects for inhalation exposures. The RfD and RfC estimate a daily exposure level for a human population that is unlikely to pose an appreciable risk during a portion or for all of a human lifetime. It is based on a review of animal and/or human toxicity data, with adjustments for various data uncertainties. Carcinogenic effects are quantified using the cancer slope factor (CSF) for ingestion and dermal exposures, and using inhalation unit risks (IUR) for inhalation exposure that are plausible upper-bound estimates of the probability of the development of cancer per unit intake of the chemical over a lifetime. These are typically based on dose-response data from human and/or animal studies.

### 5.3.1 Toxicity Criteria for Oral and Inhalation Exposures

Oral RfDs and CSFs and inhalation RfCs and IURs used in this HHRA were obtained from the following primary USEPA literature sources (December 2003):

- Tier 1 Integrated Risk Information System (IRIS).
- Tier 2 USEPA Provisional Peer Reviewed Toxicity Values (PPRTVs) The Office of Research and Development/National Center for Environmental Assessment (NCEA) Superfund Health Risk Technical Support Center develops PPRTVs on a chemical-specific basis when requested by USEPA's Superfund program.
- Tier 3 Other Toxicity Values These sources include but are not limited to California Environmental Protection Agency (Cal EPA) toxicity values, Agency for Toxic Substances and Disease Registry (ATSDR) values, and the Annual Health Effects Assessment Summary Tables (HEAST) (USEPA, July 1997).

Although toxicity criteria can be found in several toxicological sources, USEPA's IRIS online database is the preferred source of toxicity values. This database is continuously updated, and the presented values have been verified by USEPA. The toxicity criteria for the constituents selected as COPCs are presented in Tables 5-36 through 5-39.

### 5.3.2 <u>Toxicity Criteria for Dermal Exposure</u>

RfDs and CSFs in the scientific literature are typically expressed as "administered" (i.e., not absorbed) doses. Therefore, these values are considered inappropriate for estimating risks associated with dermal exposures. Oral dose response parameters based on administered doses must be adjusted to absorbed doses before they can be compared to estimated dermal exposure intakes.

When oral absorption is essentially complete (i.e., 100 percent), an absorbed dose is equivalent to the administered dose, and therefore no toxicity adjustment is necessary. Conversely, when the gastrointestinal absorption of a chemical is poor (e.g., 1 percent), the absorbed dose is smaller than the administered dose; thus, toxicity factors based on absorbed dose should be adjusted to account for the difference in the absorbed dose relative to the administered dose. USEPA (July 2004) recommends a 50 percent absorption cut-off to reflect the intrinsic variability in analyzing absorption studies. Therefore, the adjustment from administered to absorbed dose was only performed when the chemical specific gastrointestinal absorption efficiency was less than 50 percent. The adjustment from administered to absorbed dose was made using chemical specific gastrointestinal absorption efficiencies published in numerous sources of guidance (e.g., USEPA 2004 [the primary reference], IRIS, ATSDR toxicological profiles, etc.), using the following equations:

$$RfD_{dermal} = (RfD_{oral}) (ABS_{GI})$$
  
 $CSF_{dermal} = (CSF_{oral}) / (ABS_{GI})$ 

where:  $ABS_{GI}$  = absorption efficiency in the gastrointestinal tract

 $RfD_{dermal}$  = RfD for the dermal route of exposure  $RfD_{oral}$  = RfD for the oral route of exposure  $CSF_{dermal}$  = CSF for the dermal route of exposure  $CSF_{oral}$  = CSF of the oral route of exposure

As noted above, the preceding adjustment of the oral toxicity criteria (e.g., RfDs, CSFs) was necessary to allow quantitative evaluation of the dermal route of exposure in the baseline risk assessment. An explanation of this procedure and the need for this procedure are presented in Appendix A of USEPA RAGS Part A.

### 5.3.3 <u>Toxicity of Chromium</u>

Toxicity criteria are available for different forms of chromium, which is considered to be more toxic in the hexavalent state. Because there is no evidence to support the conclusion that hexavalent chromium is present at the site, speciation analyses were not completed for samples collected at the Site. However, risks associated with this chemical were assessed by conservatively assuming that 100 percent of the reported total chromium result is attributable to hexavalent chromium.

## 5.3.4 Toxicity of PCBs

The HHRA of PCBs was conducted per the following USEPA guidance document: PCBs: Cancer Dose-Response Assessment and Application to Environmental Mixtures (USEPA, September 1996).

This guidance presents a tiered approach to the risk assessment of PCBs. A range of CSFs for PCBs is presented for use in HHRA according to criteria that consider the environmental media investigated, type of exposure, and anticipated persistence, bioaccumulation potential, and toxicity of the PCB homologues/congeners detected in the samples.

### 5.3.5 Toxicity Criteria for the Carcinogenic Effect of PAHs

Limited toxicity values are available to evaluate the carcinogenic effects from exposure to PAHs. The most extensively studied PAH is benzo(a)pyrene, which is classified by the USEPA as a probable human carcinogen. Although CSFs are available for benzo(a)pyrene, insufficient data are available to calculate CSFs for other potentially carcinogenic PAHs. Toxic effects for these chemicals were evaluated using the toxicity equivalent factors (TEFs) that relate the potency of the other potentially carcinogenic PAHs to the potency of benzo(a)pyrene, as presented in current USEPA guidance (USEPA, July 1993). The equivalent oral CSF for a carcinogenic PAH other than benzo(a)pyrene is derived by multiplying the CSF for benzo(a)pyrene by TEF recommended for that PAH. TEFs for the individual carcinogenic PAHs are as follows:

Compound	<u>TEF</u>
Benzo(a)anthracene	0.1
Benzo(a)pyrene	1
Benzo(b)fluoranthene	0.1
Benzo(k)fluoranthene	0.01
Chrysene	0.001
Dibenzo(a,h)anthracene	1
Indeno(1,2,3-cd)pyrene	0.1

Carcinogenic PAHs acts via a mutagenic mode of action. USEPA Guidelines for Carcinogen Risk Assessment (2005a) and Supplemental Guidance of Assessing Susceptibility from Early-Life Exposure to Carcinogens (2005b) specify the use of ADAFs for carcinogens that act via a mutagenic mode of action. No chemical-specific ADAF is available for carcinogenic PAHs; therefore, USEPA's default ADAFs are

applied to the carcinogenic intakes for the carcinogenic PAHs. The following default ADAFs were applied: 10 for ages 0 to 2, 3 for ages 2 to 16, and 1 (no adjustment) for ages 16 to 70.

### 5.3.6 <u>Toxicity Criteria for Trichloroethene</u>

The toxicity factors for TCE were finalized by USEPA in September 2011. TCE has toxicity factors that address both carcinogenic and noncarcinogenic effects. Toxicological studies indicated that exposure to TCE increases the risk of kidney cancer, liver cancer, and non-Hodgkin's lymphoma. There is a sufficient weight of evidence to suggest that TCE-induced kidney tumors are a result of a mutagenic mode of action. USEPA Guidelines for Carcinogen Risk Assessment (2005a) and Supplemental Guidance of Assessing Susceptibility from Early-Life Exposure to Carcinogens (2005b) specify the use of ADAFs for carcinogens that act via a mutagenic mode of action. However, the ADAFs will only be applied to a portion of the cancer slope factor and inhalation unit risk that is attributable to kidney-induced tumors.

The oral CSF for TCE is  $4.6x10^{-2}$  (mg/kg-day)<sup>-1</sup> and the IUR is  $4.1x10^{-6}$  (µg/m³)<sup>-1</sup>. For the kidney mutagenic endpoint, the oral CSF is  $9.3x10^{-3}$  (mg/kg-day)<sup>-1</sup> and the IUR is  $1x10^{-6}$  (µg/m³)<sup>-1</sup>. There are no chemical-specific ADAFs for the kidney mutagenic endpoint; therefore, the USEPA's default ADAFs are applied to the carcinogenic toxicity factors for the kidney-related component of TCE's carcinogenic toxicity factors. The following default ADAFs should be applied: 10 for ages 0 to 2, 3 for ages 2 to 16, and 1 (no adjustment) for ages 16 to 70. For the liver cancer and non-Hodgkin's lymphoma endpoints, the oral CSF is  $3.7x10^{-2}$  (mg/kg-day)<sup>-1</sup> and the IUR is  $3x10^{-6}$  (µg/m³)<sup>-1</sup>. No ADAFs are applied to these values.

Noncarcinogenic effects are evaluated like all noncarcinogens in accordance with USEPA's risk assessment guidance (1989).

#### 5.4 RISK CHARACTERIZATION

This section provides a characterization of human health risks associated with potential exposures to COPCs at the Site. Potential risks (non-carcinogenic and carcinogenic) for human receptors resulting from exposures outlined in the exposure assessment were quantitatively determined and are discussed in this section. Sections 5.4.1 and 5.4.2 outline the methods used to quantitatively estimate the type and magnitude of potential risks for human receptors. Summaries of the risk characterization for the North Waterfront, Central Shipyard, Building 234, South Waterfront, and PCB Removal area are provided in Section 5.4.3.

Section 5 Addendum 1 FINAL

# 5.4.1 Quantitative Analysis of Chemicals

Quantitative estimates of risk for chemicals were calculated according to risk assessment methods outlined in USEPA guidance (USEPA, December 1989). Lifetime cancer risks are expressed in the form of dimensionless probabilities, referred to as ILCRs, based on CSFs and IURs. Non-carcinogenic risk estimates are presented in the form of HQs that are determined through a comparison of intakes with published RfDs and RfCs.

ILCR estimates for ingestion and dermal exposures were generated for each COPC using estimated exposure intakes and published CSFs, as follows:

ILCR = (Estimated Exposure Intake)(CSF)

ILCRs estimates for inhalation exposures were generated for each COPC using estimated exposure concentrations and published IURs, as follows:

ILCR = (IUR)(Exposure Concentration)(1000  $\mu$ g/mg)

An ILCR of 1x10<sup>-6</sup> indicates that the exposed receptor has an one-in-one-million chance of developing cancer under the defined exposure scenario. Alternatively, such a risk may be interpreted as representing one additional case of cancer in an exposed population of one million people.

Non-carcinogenic risks were assessed using the concept of HQs and Hls. The HQ for a COPC is the ratio of the estimated intake to the RfD and is calculated for ingestion and dermal exposures as follows:

HQ = (Estimated Exposure Intake)/(RfD)

For inhalation exposures, HQ is calculated as follows:

HQ = (Exposure Concentration)/(RfC)

An HI was generated by summing the individual HQs for all COPCs. The HI is not a mathematical prediction of the severity of toxic effects and therefore is not a true "risk"; it is simply a numerical indicator of the possibility of the occurrence of noncarcinogenic (threshold) effects.

# 5.4.2 <u>Interpretation of Risk Assessment Results</u>

To interpret the quantitative risk estimates and to aid risk managers in determining the need for remediation, quantitative risk estimates were compared to typical USEPA risk benchmarks. Calculated ILCRs were interpreted using USEPA's target cancer risk range (1x10<sup>-4</sup> to 1x10<sup>-6</sup>) and RIDEM's cumulative cancer benchmark of 1x10<sup>-5</sup>. HIs were evaluated against a benchmark value of 1.

USEPA defines the range of 1x10<sup>-4</sup> to 1x10<sup>-6</sup> as the ILCR target range for hazardous waste facilities addressed under the CERCLA and the Resource Conservation Recovery Act (RCRA). Individual or cumulative ILCRs greater than 1 x 10<sup>-4</sup> are generally considered "unacceptable" by USEPA. Risk management decisions are necessary when the ILCR is within 1x10<sup>-4</sup> to 1x10<sup>-6</sup>. USEPA typically does not require remediation when the cumulative ILCR is less than 1x10<sup>-6</sup>. Similarly, cumulative ILCRs greater than 1x10<sup>-5</sup> are generally considered to be "unacceptable" by the State of Rhode Island; remediation may or may not be necessary when the cumulative ILCR exceeds 1x10<sup>-5</sup>.

A HI exceeding unity (1.0) indicates that there may be non-carcinogenic health risks associated with exposure. If a HI exceeds unity, target organ effects associated with exposure to COPCs are considered. Only those HQs for chemicals that affect the same target organ(s) or exhibit similar critical effect(s) are regarded as truly additive. Consequently, it may be possible for the cumulative HI to exceed 1.0, but no adverse health effects are anticipated if the COPCs do not affect the same target organ or exhibit the same critical effect (i.e., target-organ/critical effect-specific HIs do not exceed 1).

### 5.4.3 Results of the Risk Characterization

This section contains a summary of the results of the risk characterization for the North Waterfront, Central Shipyard, South Waterfront, former Building 234, and PCB removal area. Quantitative risk estimates for potential human receptors were developed for those chemicals identified as COPCs. The methodology used to calculate the risks presented in this section was discussed in Sections 5.2 and 5.3. Potential risks from direct contact exposures to surface soil, subsurface soil, and groundwater are discussed in Sections 5.4.4.1 through 5.4.4.10. Uncertainties associated with the risk estimates are discussed in Section 5.5.

Potential cancer risks and hazard indices were calculated for current/future adolescent and adult trespassers, current/future construction workers, current/future industrial workers, and hypothetical future child and adult residents and are summarized in Tables 5-40 through 5-44. Chemicals retained as COCs

are summarized in Tables 5-45 and 5-49. Sample calculations are presented in Appendix F.4, and the results of the risk assessment in RAGS Part D format are included in Appendix F.2.

### 5.4.3.1 Non-Carcinogenic Risks – North Waterfront

Table 5-40 presents the HIs for exposures to surface soil, subsurface soil, and groundwater at the North Waterfront. Cumulative HIs (developed on a target-organ/effect specific basis) for all receptors under current and future scenarios were less than or equal to unity (1) with the exception of hypothetical child and adult residents. The HIs of 6 for hypothetical child residents and 4 for hypothetical adult residents for exposures to groundwater exceeded the acceptable level of 1. TCE was the major contributor to the hazard index.

### 5.4.3.2 Carcinogenic Risks – North Waterfront

Table 5-40 presents the ILCRs for the North Waterfront. Cumulative ILCRs for all receptors were within the USEPA's target risk range of  $10^{-4}$  to  $10^{-6}$  with the exception of those for the hypothetical child and lifelong residents. The ILCR of  $2x10^{-4}$  for hypothetical child residents and  $2x10^{-4}$  for hypothetical lifelong residents exposed to surface soil and groundwater exceeds USEPA's target risk range. However the ILCRs for hypothetical child (ICLR =  $6x10^{-5}$ ) and lifelong residents (ICLR =  $7x10^{-5}$ ) exposed to surface soil were within USEPA's target risk range. The ILCRs of  $1x10^{-4}$  for hypothetical child and lifelong residents exposed to groundwater were equal to the upper bound of USEPA's target risk range.

Cumulative ILCRs for all receptors with the exception of hypothetical child, adult, and lifelong residents were less than RIDEM's cumulative cancer risk benchmark of 1x10<sup>-5</sup>. The ILCRs for hypothetical child residents exposed to surface soil, subsurface soil, and groundwater exceeded the RIDEM benchmark. The ILCR for hypothetical adult residents exposed to groundwater and hypothetical lifelong residents exposed to surface soil, subsurface soil, and groundwater exceeded RIDEM's cumulative cancer risk benchmark. Carcinogenic PAHs and arsenic were the major contributors to the ILCRs for exposure to surface soil and subsurface soil. TCE, vinyl chloride, and chromium were the major contributors to the ILCRs for groundwater.

### 5.4.3.3 Non-Carcinogenic Risks – Central Shipyard

Table 5-41 presents the HIs for exposures to surface soil, subsurface soil, and groundwater at the Central Shipyard. Cumulative HIs for current and future adolescent and adult trespassers and current industrial workers were less than unity (1). HIs for current/future construction workers, future industrial workers and

hypothetical child and adult residents exposed to surface soil and subsurface soil were less than unity. His for hypothetical child residents exposed to surface soil and subsurface soil were 3 and 2 respectively, although as show below, the His for the individual target organs were all less than or equal to 1.

Hypothetical Child Residents		
Tannat Onnan	Hazard Quotient	
Target Organ	Surface Soil	Subsurface Soil
Central Nervous System	0.2	0.1
Cardiovascular System	1	0.9
Gastrointestinal System	0.6	0.5
Respiratory System	0.0002	0.0002
None Reported	0.07	0.06
Skin	1	0.9
Thyroid	0.6	0.5

The HI for construction workers exposed to groundwater was 2, although as show below, the HIs for the individual target organs were all less than or equal to 1.

Future Construction Workers		
Target Organ	Hazard Quotient	
Central Nervous System	1	
Cardiovascular System	0.1	
Gastrointestinal System	0.04	
Skin	0.1	
Thyroid	0.003	
Kidney	0.009	

HIs for future industrial workers, hypothetical child residents, and hypothetical adult residents exposed to groundwater were 7, 56, and 24, respectively. Arsenic (HI = 3) and manganese (HI = 4) were the major contributors to the HI for industrial workers exposed to groundwater. Arsenic, (HI = 17), cobalt (HI = 5), iron (HI = 6), and manganese (HI = 28) were the major contributors to the HI for hypothetical child residents exposed to groundwater. Arsenic (HI = 7), cobalt (HI = 2), iron (HI = 3), and manganese (HI = 12) were also the major contributors to the HI for hypothetical adult residents exposed to groundwater.

## 5.4.3.4 Carcinogenic Risks – Central Shipyard

Table 5-41 presents the ILCRs for the Central Shipyard. Cumulative ILCRs for all receptors were within the USEPA's target risk range of  $10^{-4}$  to  $10^{-6}$  with the exception of those for the future industrial workers and hypothetical child, adult and lifelong residents. However the ILCRs for future industrial workers and hypothetical adult residents exposed to surface soil and subsurface soil and hypothetical child residents exposed to subsurface soil were within USEPA's target risk range. The ILCR of  $1 \times 10^{-4}$  for hypothetical child residents exposed to surface soil and hypothetical lifelong residents exposed to surface soil and subsurface soil was equal to the upper bound of USEPA's target risk range. The ILCRs for exposures to groundwater by future industrial workers (ILCR =  $4 \times 10^{-4}$ ), hypothetical child residents (ILCR =  $6 \times 10^{-4}$ ), hypothetical adult residents (ILCR =  $1 \times 10^{-3}$ ), and hypothetical lifelong residents (ILCR =  $2 \times 10^{-3}$ ) exceed USEPA's target risk range. Arsenic was the major contributors to the ILCRs for groundwater.

Cumulative ILCRs for current and future adolescent, adult, and lifelong trespassers, and current/future construction workers were less than RIDEM's cumulative cancer risk benchmark of 1 x 10<sup>-5</sup>. The ILCRs for current industrial workers exposed to surface soil, and future industrial workers, hypothetical child, adult, and lifelong residents exposed to surface soil, subsurface soil, and groundwater exceeded the RIDEM benchmark. Arsenic and chromium was the major contributor to the ILCRs for current and future industrial workers exposed to surface soil. Carcinogenic PAHs, arsenic, and chromium were the major contributors to the ILCRs for hypothetical child, adult, and lifelong residents exposed to surface soil and subsurface soil. Arsenic was the major contributors to the ILCRs for groundwater.

### 5.4.3.5 Non-Carcinogenic Risks – Former Building 234

Table 5-42 presents the HIs for exposures to surface soil, subsurface soil, and groundwater at former Building 234. Cumulative HIs for current and future adolescent trespassers, adult trespassers, industrial workers, and hypothetical adult residents were less than unity (1). HIs for construction workers exposed to surface soil and subsurface soil were 2 and 2 respectively, although as show below, the HIs for the individual target organs were all less than or equal to 1.

Future Construction Workers	
Target Organ	Hazard Quotient
Central Nervous System	1
Cardiovascular System	0.3
Gastrointestinal System	0.08
None Specified	0.002

Future Construction Workers	
Target Organ	Hazard Quotient
Skin	0.3
Thyroid	0.007

HIs for hypothetical child residents exposed to surface soil and subsurface soil were 3 and 3 respectively, although as shown below, the HIs for the individual target organs were all less than or equal to 1.

Hypothetical Child Residents		
Torget Organ	Hazard Quotient	
Target Organ	Surface Soil	Subsurface Soil
Central Nervous System	0.3	0.5
Cardiovascular System	0.8	1
Gastrointestinal System	0.6	0.6
Kidney	0.4	0
Respiratory System	0.0004	0.0002
None Reported	0.4	0.1
Skin	0.8	1
Thyroid	0.8	0.6

The HI for hypothetical child residents exposed to groundwater was 4. Manganese (HQ = 2) was the major contributor to the HI.

The HI for hypothetical adult residents exposed to groundwater was 2, although as show below, the HIs for the individual target organs were all less than or equal to 1.

Hypothetical Adult Residents		
Target Organ	Hazard Quotient	
Central Nervous System	0.7	
Cardiovascular System	1	
Developmental	0.2	
Gastrointestinal System	0.02	
Kidney	1	
Liver	0.9	
Skin	0.1	
Thyroid	0.2	

# 5.4.3.6 Carcinogenic Risks – Former Building 234

Table 5-42 presents the ILCRs for the former Building 234. Cumulative ILCRs for all receptors were within the USEPA's target risk range of 10<sup>-4</sup> to 10<sup>-6</sup> with the exception of those for hypothetical child and lifelong residents. The ILCR of 1x10<sup>-4</sup> for hypothetical child and lifelong residents exposed to subsurface soil was equal to the upper bound of USEPA's target risk range. The ILCRs of 3x10<sup>-4</sup> for hypothetical child residents and 4x10<sup>-4</sup> for hypothetical lifelong residents exposed to surface soil exceeds USEPA's target risk range. Carcinogenic PAHs, arsenic, and chromium were the major contributors to the ILCRs for surface soil.

Cumulative ILCRs for current and future adolescent, adult, and lifelong trespassers and current/future construction workers were less than or equal to RIDEM's cumulative cancer risk benchmark of 1x10<sup>-5</sup>. The ILCRs for current industrial workers exposed to surface soil and future industrial workers exposed to surface soil and subsurface soil exceeded the RIDEM benchmark. The ILCRs for hypothetical child, adult, and lifelong residents exposed to surface soil, subsurface soil, and groundwater exceeded the RIDEM benchmark. Arsenic and chromium were the major contributors to the ILCRs for current and future industrial workers exposed to surface soil and subsurface soil. Carcinogenic PAHs, arsenic, and chromium were the major contributors to the ILCRs for hypothetical child, adults, and lifelong residents exposed to surface soil and subsurface soil. TCE, vinyl chloride, and arsenic were the major contributors to the ILCRs for hypothetical child, adult, and lifelong residents exposed to groundwater.

### 5.4.3.7 Non-Carcinogenic Risks – South Waterfront

There are no surface soil or groundwater samples available for the South Waterfront; therefore only exposures to subsurface soils were evaluated. Receptors under current land use are only exposed to surface soil; consequently no HIs or ILCRs were calculated for these receptors at the South Waterfront. Table 5-43 presents the HIs for exposures to subsurface soil at the South Waterfront. Cumulative HIs for all receptors were less than unity (1) with the exception of the hypothetical child resident. The HI for hypothetical child residents exposed to subsurface soil was 3, although as shown below, the HIs for the individual target organs were all less than or equal to 1.

Hypothetical Child Residents	
Target Organ	Hazard Quotient
Central Nervous System	0.2
Cardiovascular System	1
Gastrointestinal System	0.8

Hypothetical Child Residents	
Target Organ	Hazard Quotient
Respiratory System	0.0004
None Reported	0.08
Skin	1
Thyroid	1

## 5.4.3.8 Carcinogenic Risks – South Waterfront

Table 5-43 presents the ILCRs for the South Waterfront. Cumulative ILCRs for all receptors were within the USEPA's target risk range of 10<sup>-4</sup> to 10<sup>-6</sup> with the exception of those for the hypothetical child and lifelong residents. The ILCR of 1x10<sup>-4</sup> for hypothetical child and lifelong residents exposed to subsurface soil were equal to the upper bound of USEPA's target risk range.

Cumulative ILCRs for future adolescent, adult, and lifelong trespassers, and current/future construction workers were less than RIDEM's cumulative cancer risk benchmark of 1x10<sup>-5</sup>. ILCRs for future industrial workers, hypothetical child, adult, and lifelong residents exceeded the RIDEM benchmark. Arsenic and chromium were the major contributor to the ILCRs for exposures to subsurface soil.

### 5.4.3.9 Non-Carcinogenic Risks – PCB Removal Area

Table 5-44 presents the HIs for exposures to surface soil and subsurface soil at the PCB removal area. No groundwater samples were collected for the PCB removal area; consequently HIs and ILCRs were not calculated for exposures to groundwater at the PCB removal area. Cumulative HIs for all receptors with the exception of current/future construction workers and hypothetical child residents were less than unity (1). The HI for current/future construction workers exposed to subsurface soil was 2, although as shown below, the HIs for the individual target organs were all less than or equal to 1.

Future Construction Workers		
Target Organ	Hazard Quotient	
Central Nervous System	1	
Cardiovascular System	0.4	
Gastrointestinal System	0.2	
Kidney	0.0002	
Respiratory System	0.2	

Future Construction Workers	
Target Organ Hazard Quotien	
Skin	0.6
Thyroid	0.02

The HI for construction workers exposed to surface soil was 1.

The HI for hypothetical child residents exposed to surface soil was 3, although as shown below, the HIs for the individual target organs were all less than or equal to 1.

Hypothetical Child Residents		
Target Organ	<b>Hazard Quotient</b>	
Central Nervous System	0.3	
Cardiovascular System	1	
Gastrointestinal System	0.6	
Kidney	0.001	
Respiratory System	0.0003	
Skin	1	
Thyroid	1	

The HI for hypothetical child residents exposed to subsurface soil was 4. Arsenic (HQ = 2) was the major contributors to the HI.

## 5.4.3.10 Carcinogenic Risks – PCB Removal Area

Table 5-44 presents the ILCRs for the PCB removal area. Cumulative ILCRs for all receptors were within the USEPA's target risk range of  $10^{-4}$  to  $10^{-6}$  with the exception of those for the hypothetical child and lifelong residents. The ILCR of  $1x10^{-4}$  for hypothetical child exposed to subsurface soil was equal to the upper bound of USEPA's target risk range. The ILCR's for hypothetical child residents exposed to surface soil (ILCR =  $5x10^{-4}$ ), and hypothetical lifelong residents exposed to surface soil (ILCR =  $2x10^{-4}$ ) exceeded USEPA's target risk range. Carcinogenic PAHs, arsenic, and chromium were the major contributors to the ILCRs for the hypothetical child and lifelong residents.

ILCRs for current adolescent, adult, and lifelong trespassers, future adult trespassers, and construction workers were less than RIDEM's cumulative cancer risk benchmark of 1x10<sup>-5</sup>. ILCRs for future adolescent and lifelong trespassers exposed to surface soil, future industrial workers and hypothetical

child, adult, and lifelong residents exposed to surface soil and subsurface soil exceed RIDEM's cumulative cancer risk benchmark. Carcinogenic PAHs and Arsenic were the major contributors to the ILCRs for exposures to surface soil. Arsenic and chromium were the major contributors to the ILCRs for future industrial workers exposed to subsurface soil. Carcinogenic PAHs, arsenic, and chromium were the major contributors to the ILCRs for hypothetical child, adult, and lifelong residents exposed to subsurface soil.

#### 5.4.3.11 Lead Risks

Lead was identified as a COPC in surface soil at Building 234. The maximum detected concentration in surface soil (189 J mg/kg) slightly exceeded the RIDEM residential DEC of 150 mg/kg but was less than OSWER soil screening level of 400 mg/kg for residential land use. Concentrations of lead only exceeded the RIDEM residential DEC in one sample. The 95% UCL of 115 mg/kg for lead is less than RIDEM residential DEC. Consequently, no adverse health effects are anticipated from residential exposures to lead in surface soil at Building 234.

### 5.4.3.12 Vapor Intrusion Risks

As discussed in Section 5.1.3 several VOCs were detected in groundwater and soil gas samples from the North Waterfront and groundwater samples at Building 234 at concentrations exceeding USEPA screening levels for VOC migration from groundwater through building foundations and into interior air. At present, there are no buildings at the North Waterfront or at former Building 234; consequently, the vapor intrusion exposure pathway is incomplete for current land use. It is possible that a building may be constructed on these areas in the future, but without knowing the details of the buildings there would be significant uncertainty associated with performing a quantitative evaluation of these areas using USEPA's Johnson and Ettinger volatilization model (2004). Instead, a semi-quantitative evaluation was conducted using USEPA's VISL Calculator (USEPA, May 2012).

The VISL Calculator is a spreadsheet tool that provides screening-level concentrations for groundwater and soil gas for default target risk levels and exposure scenarios. The VISL Calculator can assist remedial project managers in determining whether the vapor intrusion pathway has the potential to pose an unacceptable level of risk to human health by comparing subsurface and indoor air data against screening levels in the calculator.

The VISLs are calculated using the recommended approaches in existing USEPA risk assessment guidance and are based on the current understanding of the vapor intrusion pathway. Target indoor air

concentrations are calculated according to the guidance provided in Risk Assessment Guidance for Superfund (Part F) (USEPA, January 2009), which supersedes the approach that was used in USEPA's November 2002 draft vapor intrusion guidance (USEPA, 2002). The screening levels for groundwater and soil gas are calculated from the target indoor air concentrations using empirically-based conservative "generic" attenuation factors that reflect worst-case conditions. The generic VISLs are based on default exposure parameters and factors that represent RME conditions for chronic exposures. The VISL Calculator incorporates the latest toxicity values in the USEPA's RSL table and is updated as new versions are released. Hence, the calculated indoor air concentrations derived in the VISL Calculator are combined with the toxicity factors to characterize the risk. The VISL Calculator output provides the basis for this semi-guantitative screening risk evaluation for indoor air.

#### **North Waterfront**

Concentrations of TCE and vinyl chloride in groundwater samples exceeded the screening criteria for vapor intrusion (Table 5-9). Vinyl chloride was only detected in 1 of 14 groundwater samples, and TCE was detected in 8 of 14 groundwater samples. The associated chlorinated hydrocarbons, tetrachloroethene and cis- and trans -1,2-dichloroethene, were also detected. The maximum detected concentrations of these chlorinated hydrocarbons were incorporated in the VISL calculator. The residential cumulative cancer risk was  $3x10^{-5}$ , within USEPA's target risk range; however, the residential cumulative hazard index exceeded 1, primarily due to TCE. The industrial cumulative cancer risk was  $4x10^{-6}$ , within USEPA's target risk range, and the industrial cumulative hazard index was 1. The risks are presented in Table 5-45 and the VISL output is in Appendix F.5.

Concentrations of 1,3-butadiene, acrylonitrile, benzene, and TCE in soil gas samples exceeded the screening criteria for vapor intrusion (Table 5-10). 1,3-Butadiene and acrylonitrile were not detected in any surface soil, subsurface soil, or groundwater sample collected at the North Waterfront. Benzene was not detected in any groundwater sample collected at the North Waterfront. Additional chlorinated hydrocarbons were also detected in the soil gas samples. Of those chlorinated hydrocarbons that were detected in soil gas, 1,1,1-trichloroethane and 1,1-dichloroethane were not detected in groundwater.

As with groundwater, the maximum detected soil gas concentrations were incorporated in the VISL calculator. The residential cumulative cancer risk was 5x10<sup>-5</sup>, within USEPA's target risk range; however, the residential cumulative hazard index exceeded 1, primarily due to TCE. The industrial cumulative cancer risk was 9x10<sup>-6</sup>, within USEPA's target risk range, and the industrial cumulative hazard index exceeded 1, primarily due to TCE and 1,3-butadiene. The soil gas COPCs, acrylonitrile, benzene, and 1,3-butadiene were not detected in groundwater and can generally be attributed to urban air pollution. If the risks only considered chlorinated hydrocarbons, the residential cumulative cancer risk was 3x10<sup>-5</sup>,

within USEPA's target risk range; however, the residential cumulative hazard index still exceeded one. The industrial cumulative cancer risk is  $4x10^{-6}$  and the industrial cumulative hazard index is one. The risks are presented in Table 5-46 and the VISL output is in Appendix F.5.

## **Building 234**

Concentrations of TCE and vinyl chloride exceeded the screening criteria in groundwater samples collected at former Building 234 (Table 5-22). TCE and vinyl chloride were detected at maximum concentrations of 4 µg/L and 100µg/L, respectively. The associated chlorinated hydrocarbons, 1,1-dichloroethene and cis-1,2-dichloroethene, were also detected. The maximum detected concentrations of these chlorinated hydrocarbons were incorporated in the VISL calculator. The residential cumulative cancer risk was 6x10<sup>-4</sup>, greater than USEPA's target risk range, and the residential cumulative hazard index exceeded 1, primarily due to vinyl chloride. The industrial cumulative cancer risk was 4x10<sup>-5</sup>, within USEPA's target risk range, and the industrial cumulative hazard index was less than one. The risks are presented in Table 5-47 and the VISL output is in Appendix F.6.

The basis for this vapor intrusion screening risk evaluation was the use of maximum detected concentrations of contaminants in soil gas and groundwater, default exposure assumptions for reasonable maximum exposure (RME) residential and industrial exposures, and conservative attenuation factors (0.1 for soil gas to indoor air and 0.001 for groundwater to indoor air). It is evident that risks associated with vapor intrusion should be less than what was predicted in this evaluation. Based on data collected at many Navy industrial buildings, soil gas to indoor air attenuation factors typically range between 0.001 and 0.0001, thus reducing the risks associated with soil gas by a factor of more than 100. This would clearly reduce residential risks at North Waterfront to less than USEPA's target risk range and target hazard index of 1. Nonetheless, to ensure protection of human health the vapor intrusion pathway will be considered in future building construction.

### 5.4.3.13 Risk Associated With Naturally Occurring Chemicals.

As discussed in Section 5.1.2.1, chemicals detected at maximum concentrations exceeding COPC screening levels but within naturally occurring concentrations were not retained as COPCs and were not evaluated in the risk assessment presented in Sections 5.4.3.1 through 5.4.3.10. Tables 5-48 through and 5-52 present the cancer risks and hazard indices associated with these chemicals for the North Waterfront, Central Shipyard, Former Building 234, the South Waterfront, and the PCB Removal Area. RAGS Part D tables for these chemicals are presented in Appendix F.6. Also included in Tables 5-48 and 5-52 is a comparison of the cancer risks and HIs for exposures to surface soil and subsurface soil based on site-related COPCs.

HIs were less than unity for exposures to chemicals present at background concentrations for all five areas. ILCRs for all receptors exposed to chemicals present at background concentrations were less or within the USEPA target cancer risk range at all five areas. ILCRs exceeded RIDEM's acceptable risk levels for exposures to surface soil by hypothetical lifelong residents at the North Waterfront and hypothetical child and lifelong residents at the PCB Removal area. Arsenic was the major contributor to the ILCR at the North Waterfront and chromium was the major contributor to the ILCR at the PCB Removal area.

### 5.5 UNCERTAINTY ANALYSIS

This section presents a summary of uncertainties inherent in the risk assessment and includes a discussion of how they may affect the quantitative risk estimates and conclusions of the risk analysis. The baseline HHRA for the Site was performed in accordance with current USEPA guidance; however, there are varying degrees of uncertainty associated with the baseline HHRA. The following sections discuss general uncertainties in risk assessment and uncertainties specific to the risk assessment for the Site.

Uncertainty in the selection of COPCs was related to the current status of the predictive databases; the grouping of samples; the numbers, types, and distributions of samples; data quality; and the procedures used to include or exclude constituents as COPCs. Uncertainty associated with the exposure assessment included the values used as input variables for a given intake route or scenario, the assumptions made to determine EPCs, and the predictions regarding future land use and population characteristics. Uncertainty in the toxicity assessment included the quality of the existing toxicity data needed to support dose-response relationships and the weight of evidence used to determine the carcinogenicity of COPCs. Uncertainty in risk characterization is associated with exposure to multiple chemicals and the cumulative uncertainty from combining conservative assumptions made in earlier steps of the risk assessment process.

Whereas there were various sources of random uncertainty and bias, the magnitude of bias and uncertainty and the direction of bias are influenced by the assumptions made throughout the risk assessment including selection of COPCs and selection of values for dose-response relationships. Throughout the entire risk assessment, assumptions that consider safety factors were made so that the final calculated risks were overestimated.

Generally, risk assessments include two types of uncertainty, measurement and informational uncertainty. Measurement uncertainty refers to the usual variance that accompanies scientific measurements. For

example, this type of uncertainty is associated with analytical data collected for the site. The risk assessment reflects the accumulated variances of the individual values used.

Informational uncertainty stems from inadequate availability of information needed to complete the toxicity and exposure assessments. Often, this gap is significant, such as the absence of information on the effects of human exposure to low doses of a chemical, the biological mechanism of action of a chemical, or the behavior of a chemical in soil.

After the risk assessment is complete, the results must be reviewed and evaluated to identify the type and magnitude of uncertainty involved. Reliance on results from a risk assessment without consideration of uncertainties, limitations, and assumptions inherent in the process can be misleading. For example, to account for uncertainties in the development of exposure assumptions, conservative estimates were made to ensure that the particular assumptions were protective of sensitive subpopulations or the maximum exposed individuals. If a number of conservative assumptions are combined in an exposure model, the resulting calculations can propagate the uncertainties associated with those assumptions, thereby producing a much larger uncertainty for the final results. This uncertainty is biased toward over predicting both carcinogenic and non-carcinogenic risks. Thus, both the results of the risk assessment and the uncertainties associated with those results must be considered when making risk-management decisions.

This interpretation of uncertainty is especially relevant when the risks exceed the point of departure for defining "acceptable" risk. For example, when risks calculated using a high degree of uncertainty are less than an acceptable risk level (i.e., 10<sup>-6</sup>), the interpretation of no significant risk is typically straightforward. However, when risks calculated using a high degree of uncertainty exceed an acceptable risk level (i.e., 10<sup>-4</sup>), a conclusion can be difficult unless uncertainty is considered.

### 5.5.1 <u>Uncertainty in Selection of COPCs</u>

The most significant issues related to uncertainty in COPC selection at the Site are the COPC screening levels used, the absence of screening levels for a few chemicals detected in site media, and the lack of background screening. A brief discussion of each of these issues is provided in this section.

## **COPC Screening Levels**

The use of risk-based screening values based on conservative land-use scenarios (i.e., residential land use for soil and ingestion of tap water for groundwater) corresponding to ILCRs of 10<sup>-6</sup> and HIs of 0.1

ensured that all the significant contributors to risk from the site were evaluated. The elimination of chemicals present at concentrations that correspond to ILCRs less than 10<sup>-6</sup> and HIs less than 0.1 should not have affected the final conclusions of the risk assessment because those chemicals were not expected to cause a potential health concern at the detected concentrations.

### **Chemicals without Established Screening Levels**

USEPA RSLs are currently not available for some constituents detected at the Site [e.g., acenaphthylene, benzo(g,h,i)perylene, phenanthrene, and alpha- and gamma-chlordane]. For COPC screening, acenaphthene was used as a surrogate for acenaphthylene, pyrene was selected as a surrogate for benzo(g,h,i)perylene and phenanthrene, and chlordane was selected as a surrogate for alpha- and gamma-chlordane. Applying toxicity values for one compound to another compound increases the uncertainty in the risk assessment both in regard to the selection of COPCs and the calculated risks. The direction of the uncertainty is not known.

In addition there are no USEPA RSLs of RIDEM direct contact criteria available for carbazole, creosote, and di-n-octyl phthalate. Carbazole was detected in 1 of 7 surface soil samples at the Central Shipyard. At former Building 234 carbazole was detected in 2 of 8 surface soil samples and di-n-octyl phthalate was detected 1 of 8 in surface soil samples along with elevated concentrations of PAHs, which have been identified as COCs at former Building 234. Carbazole and di-n-octyl phthalate were not detected in subsurface soil at former Building 234. The lack of risk-based screening criteria for these chemicals increases the uncertainty in the risk assessment both in regard to the selection of COPCs and the calculated risks. Although the uncertainty does not impact the conclusions of this risk assessment since these chemicals were detected infrequently and at low concentrations or they were co-located with chemicals identified as major risk drivers. Samples that were analyzed for creosote were also analyzed for PAHs, which were retained as COPCs in some areas. Consequently, the absence of screening criteria does not introduce any significant uncertainty into the risk assessment.

Also there are no USEPA SSLs or RIDEM GA leachability criteria available for carbazole, creosote, dinoctyl phthalate, dibutyltin, monobutyltin, tetrabutyltin, and tributyltin. These chemicals were not detected in groundwater samples collected at the Site indicating that carbazole, di-n-octyl phthalate, dibutyltin, monobutyltin, tetrabutyltin, and tributyltin in soil have not migrated to groundwater. Consequently, given the absence of detection of these compounds in groundwater, the HHRA conclusions are unlikely to be affected by the lack of screening levels for these chemicals. Samples that were analyzed for creosote were also analyzed for PAHs, which were identified as exceeding screening levels in some areas.

Section 5 Addendum 1 FINAL

Consequently, the absence of screening criteria does not introduce any significant uncertainty into the risk assessment.

### 5.5.2 Uncertainty in the Exposure Assessment

Uncertainty in the exposure assessment arose because of the methods used to calculate EPCs, the determination of land-use conditions, the selection of receptors and scenarios, and the selection of exposure parameters. Each of these is discussed below.

## **Exposure Point Concentrations**

Uncertainty is associated with the use of 95-percent UCLs on the mean concentration as EPCs. As a result of using 95-percent UCLs, the estimations of potential risk for the RME scenario were most likely overstated because UCLs represent the upper limit that potential receptors would be exposed to over the entire exposure period.

In cases where there were an insufficient number of samples to calculate an UCL or the UCL was greater than the maximum detected concentration, the maximum detected concentration was used as the EPC. Use of the maximum concentration tends to overestimate potential risks because receptors are assumed to be exposed continuously to the maximum concentration for the entire exposure period.

Dibenzo(a,h)anthracene was retained as a COC in surface soil at Former Building 234. Dibenzo(a,h)anthracene was detected in only 1 of 7 surface soil samples, consequently the maximum detected concentration was used as the exposure point concentration. Although the use of the maximum detected concentration as the EPC overestimates the risks associated with exposures to dibenzo(a,h)anthracene, the conclusions of the HHRA are not effect because several other carcinogenic PAHs was also retained as COCs for surface soil at Former Building 234. Carcinogenic PAHs were retained as COCs for surface soil at the PCB Removal Area. There were only four surface soils samples available for this area; therefore the maximum detected concentration was used as the EPC for carcinogenic PAHs in surface soil at the PCB Removal Area. Concentrations of carcinogenic PAHs were only elevated in one surface soil sample. Concentrations of carcinogenic PAHs in the other surface soil samples are approximately 30 times lower than the maximum detected concentrations. Consequently the use of the maximum detected concentrations likely overestimates the risks calculated for exposures to carcinogenic PAHs in surface soil at the PCB Removal Area.

The maximum detected concentration was also used as the EPC for groundwater at the North Waterfront, Central Shipyard, and Former Building 234. The use of the maximum detected concentration as the EPC in groundwater is overly conservative because the maximum detected concentrations of the COPCs do not all occur in the same well. Also groundwater is not a static medium and the concentration at a well will likely change over time. Consequently the use of the maximum detected concentrations likely overestimates the risks calculated for exposures to groundwater.

EPCs for construction workers hypothetically exposed to VOCs migrating from shallow groundwater to air were estimated using a VDEQ model for exposure of construction workers to vapors accumulating in an excavation trench. Site-specific parameters such as groundwater concentrations were used in the model. However, it was necessary to use model default values for most of the other input parameters. The use of model default values tended to increase the uncertainty in the calculated risks. The direction of the uncertainty was not known, although the model default values are generally conservative and tend to overestimate air concentrations.

#### **Land Use**

The current land-use patterns at NAVSTA Newport are well established, thereby limiting the uncertainty associated with land-use assumptions. Land use at the Site is currently limited and is expected to be limited in the future, as long as the NAVSTA Newport remains active (construction workers, industrial workers, and potential and infrequent trespassers are the only current and likely future receptors). To be conservative, risks to hypothetical residents were also estimated for the site.

# **Exposure Routes and Receptor Identification**

The determination of various receptor groups and exposure routes of potential concern was based on current land use at the site and anticipated future land use. Therefore, the uncertainty associated with the selection of exposure routes and potential receptors was minimal because they were considered to be well defined. Although industrial and residential use of groundwater was evaluated as an exposure scenario at the Site, groundwater is not currently used at the site, nor is it expected to be used in the future. Therefore, the evaluation of direct exposure to groundwater performed in this baseline HHRA was included primarily to aid in risk-management decision making.

As discussed in Section 5.1.3 several VOCs were detected in groundwater and soil gas samples from the North Waterfront and groundwater samples at Building 234 at concentrations exceeding USEPA screening levels for VOC migration from groundwater through building foundations and into interior air. At

present, there are no buildings at the North Waterfront or at former Building 234; consequently, the vapor intrusion exposure pathway is incomplete for current land use. It is possible that a building may be constructed on these areas in the future, but without knowing the details of the buildings there would be significant uncertainty associated with performing a quantitative evaluation of these areas using USEPA's Johnson and Ettinger volatilization model (2004). Instead, a semi-quantitative evaluation was conducted using USEPA's VISL Calculator (USEPA, May 2012).

### **Exposure Parameters**

Each exposure factor selected for use in the risk assessment had some associated uncertainty. Generally, exposure factors were based on surveys of physiological and lifestyle profiles across the United States. The attributes and activities studied in these surveys generally had a broad distribution. To avoid underestimation of exposure, in most cases, USEPA guidelines on the RME receptor were used, which generally specify the use of the 95<sup>th</sup> percentile value for most parameters. Therefore, the selected values for the receptors represented an upper bound of the observed or expected habits of the majority of the population.

Generally, the uncertainty can be assessed quantitatively for many assumptions made in determining factors for calculating exposures and intakes. Many of these parameters were determined from statistical analyses on human population characteristics. Often, the database used to summarize a particular exposure parameter (i.e., body weight) is quite large. Consequently, the values chosen for such variables in the RME scenario have low uncertainty.

### 5.5.3 Uncertainty in the Toxicological Evaluation

Uncertainties associated with the toxicity assessment (determination of RfDs and CSFs and use of available criteria) are discussed in this section.

### **Derivation of Toxicity Criteria**

Uncertainty associated with the toxicity assessment was associated with hazard assessment and dose-response evaluations for the COPCs. The hazard assessment characterized the nature and strength of the evidence of causation or the likelihood that a chemical that induces adverse effects in animals will also induce adverse effects in humans. Hazard assessment of carcinogenicity was evaluated as a weight-of-evidence determination using USEPA methods. Positive animal cancer test data may suggest that humans contain tissue(s) that may manifest a carcinogenic response; however, the animal

data cannot necessarily be used to predict the target tissue in humans. In the hazard assessment of noncancer effects, however, positive animal data often suggest the nature of the effects (i.e., the target tissues and type of effects) anticipated in humans.

Uncertainty in hazard assessment arose from the nature and quality of the animal and human data. Uncertainty was reduced when similar effects were observed across species, strain, sex, and exposure route; when the magnitude of the response was clearly dose-related; when pharmacokinetic data indicated a similar fate in humans and animals; when postulated mechanisms of toxicity were similar for humans and animals; and when the COPC was structurally similar to other chemicals for which the toxicity is more completely characterized.

Uncertainty in the dose-response evaluation included the determination of a CSF for the carcinogenic assessment and derivation of an RfD for the non-carcinogenic assessment. Uncertainty was introduced from interspecies (animal to human) extrapolation, which, in the absence of quantitative pharmacokinetic or mechanistic data, is usually based on consideration of interspecies differences in basal metabolic rate. Uncertainty also resulted from intraspecies variation. Most toxicity experiments are performed with animals that are very similar in age and genotype, so intragroup biological variation is minimal, but the human population of concern may reflect a great deal of heterogeneity, including unusual sensitivity or tolerance to the COPC. Even toxicity data from human occupational exposure reflect a bias because only those individuals sufficiently healthy to attend work regularly (the "healthy worker effect") and those not unusually sensitive to the chemical are likely to be occupationally exposed. Finally, uncertainty arises from the quality of the key study from which the quantitative estimate was derived and the database used.

For cancer effects, the uncertainty associated with dose-response factors was mitigated by assuming the 95-percent upper bound for the slope factor. Another source of uncertainty in carcinogenic assessment is the method by which data from high doses in animal studies are extrapolated to the dose range expected for environmentally exposed humans. The linearized multistage model, which is used in nearly all quantitative estimations of human risk from animal data, is based on a nonthreshold assumption of carcinogenesis. Evidence suggests, however, that epigenetic carcinogens, as well as many genotoxic carcinogens, have a threshold below which they are non-carcinogenic. Therefore, the use of the linearized multistage model was conservative for chemicals that exhibited a threshold for carcinogenicity.

For non-cancer effects, additional uncertainty factors may have been applied in the derivation of the RfD to mitigate poor quality of the key study or gaps in the database. Additional uncertainty for non-cancer effects arose from the use of an effect level in the estimation of an RfD, because this estimation was predicated on the assumption of a threshold less than which adverse effects were not expected.

Therefore, an uncertainty factor is usually applied to estimate a no-effect level. Additional uncertainty arose in estimation of an RfD for chronic exposure from subchronic data. Unless empirical data indicated that effects did not worsen with increasing duration of exposure, an additional uncertainty factor was applied to the no-effect level in the subchronic study. Uncertainty in the derivation of RfDs was mitigated by the use of uncertainty and modifying factors that normally ranged between 3 and 10. The resulting combination of uncertainty and modifying factors may have reached 1,000 or more.

The derivation of dermal RfDs and CSFs from oral values may have caused uncertainty. This was particularly the case when no gastrointestinal absorption rates were available in the literature or when only qualitative statements regarding absorption were available.

## **Uncertainty in the Toxicity Criteria for Chromium**

Toxicity criteria are available for different forms of chromium, which is considered to be more toxic in the hexavalent state. Although there is no evidence to support the conclusion that hexavalent chromium is present at the Site, risks associated with this chemical were assessed by conservatively assuming that 100 percent of the reported chromium result is attributable to hexavalent chromium. If chromium had been evaluated as trivalent chromium then ILCRs and HIs for chromium would be within acceptable levels and chromium would not have been retained as a COC for soil and groundwater. Also the cumulative ILCRs for exposures to groundwater at former Building 234 by hypothetical child and lifelong residents would be within USEPA acceptable levels, but still exceed the RIDEM cumulative cancer risk benchmark. Therefore, the risks calculated for chromium in soil and groundwater at the Site are likely overestimated.

### **Use of Chronic Toxicity Values for Construction Workers**

Under the guidelines established by the Superfund program, the one year exposure duration assumed for the construction worker should be evaluated as a subchronic exposure. Risks for noncarcinogenic effects associated with subchronic exposures should be developed using subchronic toxicity criteria, not chronic toxicity values. Subchronic toxicity values used in this HHRA were obtained from USEPA's PPRTV internet site if available. Also, ATSDR Minimal Risk Levels (MRLs) were used as subchronic toxicity values when subchronic PPRTV values were not available. However, subchronic toxicity values are not as widely available as chronic toxicity values (e.g., subchronic toxicity criteria are not currently available for aluminum and manganese). Therefore, chronic toxicity values were used when subchronic toxicity values were not available. This likely resulted in an overestimation of potential noncarcinogenic risks for the construction worker receptor because subchronic toxicity values may be up to an order of magnitude

higher than chronic toxicity values. Therefore, the "unacceptable HIs" identified for current/future construction workers exposed through inhalation of aluminum and manganese in fugitive dust emissions from subsurface soil at the South Waterfront and PCB removal area may actually not exceed 1. Consequently, hazard indices for current/future construction workers may be within acceptable levels at the South Waterfront and PCB removal area.

### 5.5.4 <u>Uncertainty in the Risk Characterization</u>

Uncertainty in risk characterization resulted from assumptions made regarding additivity of effects from exposure to multiple COPCs from various exposure routes. High uncertainty exists when summing non-cancer risks for several substances across different exposure pathways. This assumes that each substance has a similar effect and/or mode of action. Even when chemicals affect the same target organs, they may have different mechanisms of action or differ in their fate in the body, so additivity may not be an appropriate assumption in all cases. However, the assumption of additivity was considered because in most cases it represented a conservative estimate of risk.

Risks to any individual may also have been overestimated by summing multiple assumed exposure pathway risks for any single receptor. Although every effort was made to develop reasonable scenarios, not all individual receptors may be exposed via all pathways considered.

Finally, the risk characterization did not consider antagonistic or synergistic effects. Little or no information was available to determine the potential for antagonism or synergism for the COPCs. Because chemical-specific interactions could not be predicted, the likelihood for risks to be overpredicted or underpredicted could not be defined, but the methodology used was based on current USEPA guidance.

#### 5.6 SUMMARY

The baseline HHRA for the Former Robert E. Derecktor Shipyard at the NAVSTA Newport was conducted to characterize the potential risks to likely human receptors under current and potential future land use. This HHRA is an update of the HHRA presented in the SASE Report (B&RE, June 1997). Potential receptors under current land use are construction workers, industrial workers, and adolescent and adult trespassers. Potential receptors evaluated in the HHRA for future land use are construction workers, industrial workers, adolescent and adult trespassers, and hypothetical child and adult residents. Although future land use is likely to be the same as current land use, potential future receptors were evaluated in the baseline HHRA, primarily for decision-making purposes.

The Site was divided into five areas for the purposes of selecting COPCs; the North Waterfront, Central Shipyard, Building 234, South Waterfront, and the PCB Removal Area. Chemicals retained as COPCs are summarized in Table 5-29. PAHs and metals were retained as COPCs in soil. VOCs and metals were retained as COPCs in groundwater.

Quantitative estimates of non-carcinogenic and carcinogenic risks (HIs and ILCRs, respectively) were developed for potential human receptors. All receptors were evaluated for exposures to surface soil (0 to 2 foot bgs) and subsurface soil (> 2 ft. bgs). Current/future construction workers, future industrial workers, and hypothetical residents were also evaluated for exposures to groundwater. The results of the HHRA are summarized below. Chemicals retained as COCs are summarized in Tables 5-53 and 5-57.

### Noncarcinogenic Risks

HIs on a target organ basis for all receptors exposed to site-related COPCs in surface and subsurface soil were less than or equal to unity (1), with the exception of hypothetical child residents exposed to subsurface soil at the PCB removal area. Arsenic was the major contributor to the HI for hypothetical child residents.

HIs for all receptors exposed to site-related COPCs in groundwater were less than or equal to unity (1), with the exception of hypothetical child and adult residents at the North Waterfront, future industrial workers, hypothetical child residents, and hypothetical adult residents at the Central Shipyard and hypothetical child residents at former Building 234. TCE was the major contributor to the HI for hypothetical child and adult residents exposed to groundwater at the North Waterfront. Arsenic and manganese were the major contributors to the HI for future industrial workers exposed to groundwater at the Central Shipyard. Arsenic, cobalt, iron, and manganese were the major contributor to the HI for hypothetical child and adult residents exposed to groundwater at the Central Shipyard. Manganese were the major contributors to the HI for hypothetical child residents exposed to groundwater at former Building 234.

### **Carcinogenic Risks**

ILCRs for the following receptors/media exceed USEPA and RIDEM risk management benchmarks:

Area	Medium	ILCR Exceeds USEPA's Target Risk Range of 10 <sup>-4</sup> to 10 <sup>-6</sup>	ILCR Exceeds RIDEM's Cumulative Risk Level of 10 <sup>-5</sup>
North	Surface Soil	ILCRs within Target Risk Range	Hypothetical Child Residents
Waterfront			Hypothetical Lifelong Residents
	Subsurface	ILCRs within Target Risk Range	Hypothetical Child Residents

Area	Medium	ILCR Exceeds USEPA's Target Risk Range of 10 <sup>-4</sup> to 10 <sup>-6</sup>	ILCR Exceeds RIDEM's Cumulative Risk Level of 10 <sup>-5</sup>
	Soil		Hypothetical Lifelong Residents

			Hypothetical Adult Residents
			Hypothetical Lifelong Residents

Carcinogenic PAHs, arsenic, and chromium were the major contributors to the ILCRs for surface soil at former Building 234. Carcinogenic PAHs, total Aroclors, and arsenic were the major contributors to the ILCRs for surface soil and subsurface soil at PCB removal area. Arsenic was the major contributor to the ILCRs at the Central Shipyard.

Section 5 Addendum 1 FINAL

Chromium speciation was not performed on the soil samples collected at the site, therefore, chromium was evaluated as hexavalent chromium in this HHRA. If chromium had been evaluated as trivalent chromium then ILCRs and HIs for chromium would be within acceptable levels and chromium would not have been retained as a COC for surface soil at Former Building 234 and subsurface soil at the PCB Removal Area. In addition, the cumulative ILCRs for exposures to surface soil at former Building 234 by hypothetical child and lifelong residents would be within USEPA acceptable levels, but would still exceed the RIDEM cumulative cancer risk benchmark. Cumulative ILCRs for exposures to subsurface soil at the PCB Removal Area would be equal to the upper bound of USEPA's target risk range, but would still exceed the RIDEM cumulative cancer risk benchmark.

Section 6 Addendum 1 FINAL

### 6.0 SUMMARY AND CONCLUSIONS

Section 6.0 presents a summary of activities and results of the On-Shore Derecktor Shipyard SASE Addendum investigation along with the conclusions and recommendations formulated from the investigation moving forward for this Site.

#### 6.1 OBJECTIVES

The project objectives of the SASE Addendum investigation were to collect additional environmental media samples and to obtain analytical data from areas where data gaps in media quality were identified by the Navy and regulatory agencies. This data, along with historical site data, will be used to revise the 1997 baseline HHRA and to provide recommendations for future actions at the Site.

Historical environmental media sampling efforts designed to evaluate media quality were conducted in 1996 at the Site following a sandblast grit removal action in 1995. A series of additional removal actions were completed at the Site over the period from 1997 through 2007. A review of the historic dataset for the site by the Navy and regulatory agencies determined a need for supplemental confirmatory data in areas where removal actions were conducted, and a need for data in other areas containing potential contamination.

This SASE Addendum also revises the human health risk assessment presented in the SASE using historic and new data to recalculate risks to potential human receptors.

### 6.2 FIELD INVESTIGATION

The SASE Addendum investigation was conducted in five subareas of the Site including: the Southern Waterfront, former Building 234, the Central Shipyard, the PCB Removal Area (Building 6/TP-14 Area), and the Northern Waterfront. Field activities completed as part of this investigation included the advancement of soil borings, monitoring well installation, groundwater sampling, and soil gas sampling.

Thirteen surface soil samples (included three duplicate samples), 11 subsurface soil samples, 14 groundwater samples (including two duplicates), and five soil gas samples (including 1 duplicate) were collected for laboratory analysis and reporting. Laboratory analysis was sample specific but included VOCs, DRO/GRO, PAHs, PCBs, and metals.

Section 6 Addendum 1 FINAL

### 6.3 NATURE AND EXTENT OF CONTAMINATION

This report summarizes environmental media quality data collected as part of the 2011 SASE Addendum investigation at the Site. Analytical data from previous investigatory efforts at the Site are provided in the 1997 SASE report included as Appendix E-6 of this report.

Contaminant-specific concentrations were compared to PALs established in the Work Plan Addendum. PALs for soil consisted of the lowest of the USEPA RSLs (2010) and the RIDEM Residential Soil DEC. PALs for groundwater consisted of the lowest of USEPA MCL and the RIDEM GA groundwater aquifer criteria. PALs for soil gas were derived from USEPA residential air RSLs adjusted by an attenuation factor of 0.1 for shallow soil gas and 0.01 for deep soil gas.

### Southern Waterfront Area

Exceedances of the USEPA RSL screening criteria for 6 metals were identified in subsurface soil samples at the Site. Although metals in subsurface soil exceed the USEPA RSL, it is possible that the exceedances of some or all of the metals may be due to the generally elevated background levels of metals found in Newport soils.

### Building 234

Analytical results from the groundwater sample MW08 collected in this area did not contain any VOCs, PAHs, or metals above regulatory comparison criteria. Exploratory borings conducted at Sump 234-4 confirmed a concrete bottom and therefore no soil samples for laboratory analysis and reporting were collected.

#### Central Shipyard

Analytical results from two groundwater samples (MW218 and MW219) did not identify any VOCs or PAHs above regulatory comparison criteria. Arsenic was the only metal detected in groundwater at a concentration exceeding the MCL. The high concentrations of arsenic may be attributable to naturally high background levels of arsenic in Newport soils.

The Central Shipyard was the location of temporary USMC office trailers, were removed in 2012. As part of the removal process utilities associated with the trailers, including buried electrical conduits, water line, septic tank and piping were removed for off-site disposal. The Final Site Clean Up document for this effort is provided in Appendix H.

### PCB Removal Area

Elevated concentrations of PAHs (with eight compounds exceeding criteria) and metals (with six constituents exceeding RSLs) were detected in surface soil samples collected from the PCB Removal Area. SB209 contained concentrations of aroclor-1260 exceeding regulatory comparison criteria. In subsurface soil samples, slightly elevated concentrations of PAHs (with four PAHs exceeding criteria) and metals (with six metals exceeding criteria) were detected. Analytical results from four surface soil samples (SB215, SB216, SB217, and SB224) collected in the former transformer bank area did not detect PCBs above the laboratory instruments method detection limits. The distribution of contaminants suggests that the 1999 removal action conducted in this area adequately addressed PCB contamination. A sample located in an area receiving surface water runoff from a section of the Penn-Central Railway contained metals above criteria.

### Northern Waterfront

### Huts 1 and 2

Elevated concentrations of PAHs (with four compounds exceeding criteria) and metals (with seven constituents exceeding criteria) were detected in surface soil samples. In subsurface soil samples, elevated concentrations of PAHs (with two compounds exceeding RSLs) and metals with (four individual constituents exceeding RSLs) in subsurface soil samples collected from the Huts 1 and 2 area. A groundwater sample (MW204) collected in this area did not identify any contaminants above regulatory comparison criteria (VOCs and metals) or above the laboratory instruments method detection limits (PAHs).

Contaminants detected at this subarea of the Site are consistent with historical operations and activities that were conducted in this area, including vehicle maintenance. Groundwater quality results indicate that no contaminants are leaching into the overburden groundwater aquifer. This area was the site of a satellite parking lot construction project and several sample locations may have subsequently been covered by bituminous concrete paving. The former building concrete pad for Huts 1 and 2 has been demolished and removed under a previous action by the Navy.

### Groundwater

Eight groundwater monitoring wells were sampled in the Northern Waterfront Area. One VOC, TCE, was detected above regulatory comparison criteria in five of the eight groundwater samples. A comparison to the 1997 SASE groundwater analytical results indicated that VOC concentrations are lower in the 2011 sampling event than in historical sampling events. TCE is most likely the result of limited spills in former storage areas and maintenance areas that have had limited impact on the overburden groundwater aquifer.

### Soil Gas

Elevated concentrations of five VOCs (1,3-butadiene, acrylonitrile, benzene, tetrachloroethene, and TCE) were found in soil gas samples at concentrations exceeding USEPA comparison criteria. To ensure protection of human health, the vapor intrusion pathway will be considered in future building construction.

### 6.4 HUMAN HEALTH RISK ASSESSMENT

The HHRA completed in this SASE Addendum calculated risk for each of the five areas of the Site. Soil, groundwater, and soil gas analytical results from the historic and recent sampling events were used in the HHRA. Risk was evaluated for receptor exposure under residential and non-residential (industrial, commercial, and recreational) land use scenarios. The dataset used in the HHRA included groundwater and soil gas data from 2011; and soil data from 1996, 2011, and removal action confirmation samples.

Potential receptors under current land use are construction workers, industrial workers, and adolescent and adult trespassers. Potential receptors evaluated in the HHRA for future land use are construction workers, industrial workers, adolescent and adult trespassers, and hypothetical child and adult residents. Although future land use is likely to be the same as current land use, potential future receptors were evaluated in the baseline HHRA, primarily for decision-making purposes.

The Site was divided into five areas for the purposes of selecting COPCs; the North Waterfront, Central Shipyard, Building 234, South Waterfront, and the Building 6/Test Pit 14 PCB Removal area. PAHs and metals were retained as COPCs in soil. VOCs and metals were retained as COPCs in groundwater.

Quantitative estimates of non-carcinogenic and carcinogenic risks (HIs and ILCRs, respectively) were developed for potential human receptors. All receptors were evaluated for exposures to surface soil (0 to 2 foot bgs) and subsurface soil (> 2 ft. bgs). Current/future construction workers, future industrial workers, and hypothetical residents were also evaluated for exposures to groundwater.

### Noncarcinogenic Risks

Arsenic was the major contributor to the HI for hypothetical child residents exposed to subsurface soil at the PCB removal area.

TCE was the major contributor to the HI for hypothetical child and adult residents exposed to groundwater at the North Waterfront. Manganese was the major contributor to the HI for future industrial workers exposed to groundwater at the Central Shipyard. Arsenic, cobalt, iron, and manganese were the major contributors to the HI for hypothetical child and adult residents exposed to groundwater at the Central

Shipyard. Manganese was the major contributor to the HI for hypothetical child residents exposed to groundwater at former Building 234.

### **Carcinogenic Risks**

Cancer risks exceeding USEPA cancer risk range (10<sup>-4</sup> to 10<sup>-6</sup>) was determined for hypothetical residents in one area for groundwater and in two areas for soil. In addition, cancer risks exceeding the RIDEM cancer risk threshold of 10<sup>-5</sup> was determined for hypothetical receptors in each area and for current industrial workers in two areas and future industrial workers in three areas, and future trespassers in the PCB Removal Area.

The following table summarizes carcinogenic risks that exceed the USEPA cancer target risk range.

Area	Medium	Receptor	Contaminant Contributing to Cancer Risk
Central Shipyard	Groundwater	Future Industrial Workers (2E-04) Hypothetical Child Residents (6E-04) Hypothetical Adult Residents (1E-03) Hypothetical Lifelong Residents (2E-03)	Arsenic
Building 234	Surface Soil	Hypothetical Child Residents (3E-04) Hypothetical Lifelong Residents (4E-04)	PAHs, arsenic, chromium
PCB Removal Area	Surface Soil	Hypothetical Child Residents (5E-04) Hypothetical Lifelong Residents (5E-04)	PAHs, arsenic
	Subsurface Soil	Hypothetical Lifelong Residents (2E- 04)	PAHs, arsenic, chromium

Chromium speciation was not performed on the soil and groundwater samples; therefore chromium was evaluated as hexavalent chromium in the HHRA. If chromium had been evaluated as trivalent chromium then all risks from chromium would have been within USEPA and RIDEM acceptable levels.

#### 6.5 RECOMMENDATIONS

The On-Shore Derecktor Site is currently located on an active portion of NAVSTA Newport. Several construction projects are being conducted at the site to improve the site for future Navy and USCG use. Future land use will not include residential use due to the industrial nature of the site and the on-going Navy infrastructure constructions plans.

Section 6 Addendum 1 FINAL

The conclusions of the risk assessment determined that risk under the residential use scenario is present for soil and groundwater. Risk under the future industrial user scenario is present due to inadvertent ingestion of groundwater containing arsenic and manganese. Several removal actions have been conducted at the site to remove sources of contamination present from previous site uses.

This SASE addendum fulfills the role of a Remedial Investigation for this site because this report, coupled with the previous SASE report, contains the risk assessment component required by CERCLA. Based on the risks estimated for the residential and industrial workers scenarios, it is recommended that the Site be carried forward to a Feasibility Study (FS) step which will evaluate remedial alternatives for soil and groundwater.

DSY-MW222	Overburden	2	4 -14	162645.56	379356.34	10.92	10.53	10.5

Vertical control datum : NGVD 1929 MSL Horizontal control datum: NAD 1983 (1986)

MW11A was a temporary monitoring well and was not present at the time of surveying. Northing and easting coordinates are for the co-located soil gas sample location.

Notes: - USEPA Regional Screening Level, June 2011. Values is the residential

air screening level adjusted using an attenuation factor of 0.1 (VISGR1) and 0.01 (VISGR01).

Carcinogenic values represent an incremental cancer risk of 1E-06.

Noncarcinogenic values represent a hazard quotient of 0.1.

- 1 Value is for m-xylene.
- 2 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.
- 3 Value is for 1,2,4-trimethylbenzene.
- 4 Value is for trans-1,2-dichloroethene.
- 5 Screening criteria for trichloroethene was calculated using toxicity criteria from IRIS.

- 1 USEPA Regional Screening Level, May 2012. Carcinogenic values represent an incremental cancer risk of 1E-06. The noncarcinogenic values are the RSL divided by 10 to correspond to a Target Hazard Quotient of 0.1. Protection of groundwater values are risk-based SSLs.
- 2 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 3 Value is for m-xylene.
- 4 Ten percent of noncarcinogenic screening level is less than the carcinogenic screening level, therefore the noncarcinogenic value is presented.
- 5 Value is for acenaphthene.
- 6 Value is for pyrene.
- 7 Value is for chlordane.
- 8 Value is for hexavalent chromium.
- 9 Value is MCL based soil screening level.
- 10 Value is for mercuric chloride (and other mercury salts).
- 11 Value is for total xylenes.
- 12 Leachability criteria for inorganics are based on SPLP/TCLP analysis and are in units of mg/L.
- 13 Value is for dibutylin and tributyltin.
- 14 A SSL is not available for mercuric chloride therefore the value for elemental mercury is presented.
- N Noncarcinogenic
- C Carcinogenic
- NA Not Available.

### Notes:

- USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May, 2012. [Cancer benchmark value = 1E-06, Hazard index (HI) = 0.1].
- 2 2012 Edition of the Drinking Water Standards and Health Advisories (USEPA, April 2012).
- 3 RIDEM, DEM-DSR-01-93, November 2011.
- 4 USEPA Vapor Intrusion Screening Level (VISL) Calculator, Version 2.0. May 2012 RSLs. Values correspond to a target cancer risk level of 1E-6 or HI = 0.1 and an attenuation factor of 0.001.
- 5 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.
- 6 Secondary Drinking Water Regulation (USEPA, April 2012).
- 7- Value is for hexavalent chromium.
- 8 Value is for total chromium.
- 9 The MCL for this parameter is actually a treatment technique. The SDWA action level (at the tap) has been presented.

NVT = Not sufficiently volatile and/or toxic to pose inhalation risk.

NA = Not available.

## TABLE 5-3 SCREENING CRITERIA FOR SOIL GAS FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RI

CAS	Daniel de la constante de la c	Soil Gas
No.	Parameter	Screening Level <sup>(1)</sup>
Volatile Or	ganic Compounds (ug/m³)	
	1,1,1-Trichloroethane	5,200 N
76-13-1	1,1,2-Trichlorotrifluoroethane	31,000 N
75-34-3	1,1-Dichloroethane	15 C
95-63-6	1,2,4-Trimethylbenzene	7.3 N
108-67-8	1,3,5-Trimethylbenzene	7.3 N <sup>(4)</sup>
	1,3-Butadiene	0.81 C
622-96-8	1-Ethyl-4-Methyl Benzene	NA
78-93-3	2-Butanone	5,200 N
591-78-6	2-Hexanone	31 N
108-10-1	4-Methyl-2-Pentanone	3,100 N
107-13-1	Acrylonitrile	0.36 C
71-43-2	Benzene	3.1 C
	Chlorobenzene	52 N
	Chloroethane	10,000 N
	Chloroform	1.1 C
74-87-3	Chloromethane	94 N
156-59-2	cis-1,2-Dichloroethene	63 N <sup>(5)</sup>
110-82-7	Cyclohexane	6,300 N
75-71-8	Dichlorodifluoromethane	100 N
100-41-4	Ethylbenzene	9.7 C
110-54-3	Hexane	730 N
	m+p-Xylenes	100 N <sup>(2)</sup>
1634-04-4	Methyl Tert-Butyl Ether	94 C
75-09-2	Methylene Chloride	630 N <sup>(3)</sup>
142-82-5	n-Heptane	NA
95-47-6	o-Xylene	100 N
100-42-5	Styrene	1,000 N
127-18-4	Tetrachloroethene	42 N <sup>(3)</sup>
108-88-3	Toluene	5,200 N
540-59-0	Total 1,2-Dichloroethene	63 N <sup>(5)</sup>
	Total Xylenes	100 N
	Trans-1,2-Dichloroethene	63 N
	Trichloroethene	2.1 N <sup>(3)</sup>
	Trichlorofluoromethane	730 N
75-01-4	Vinyl Chloride	1.6 C

- 1 USEPA Vapor Intrusion Screening Level (VISL) Calculator, Version 2.0. May 2012 RSLs.
- 2 Value is for m-xylene.
- 3 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.
- 4 Value is for 1,2,4-trimethylbenzene.
- 5 Value is for trans-1,2-dichloroethene.
- N Noncarcinogenic
- C Carcinogenic

### TABLE 5-4

## OCCURRENCE, DISTRIBUTION, AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - DIRECT CONTACT WITH SURFACE SOIL - NORTH WATERFRONT FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND PAGE 3 OF 3

CAS Number	Chemical	Minimum Concentration <sup>(1)</sup>	Maximum Concentration <sup>(1)</sup>	Units	Sample of Maximum Concentration	Frequency of Detection	Range of Nondetects <sup>(2)</sup>	Concentration Used for Screening <sup>(3)</sup>	Background Concentration <sup>(4)</sup>	Adjusted USEPA RSL Residential Soil <sup>(5)</sup>	RIDEM Residential Direct Exposure Criteria <sup>(6)</sup>	COPC Flag	Rationale for Contaminant Deletion or Selection <sup>(7)</sup>
---------------	----------	---	---	-------	------------------------------------	------------------------------	------------------------------------	---	--	--	---	--------------	---

### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.
- 9 Value is for acenaphthene.
- 10 Value is for pyrene.
- 11 Value is for chlordane.
- 12 Value is for hexavalent chromium.
- 13 Value is for mercuric chloride (and other mercury salts).
- 14 Value is for dibutylin and tributyltin.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

### **Definitions:**

C = Carcinogen

COPC = Chemical Of Potential Concern

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

#### **Rationale Codes:**

For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:

BKG = Within Background Levels

BSL = Below COPC Screening Level

NTX = No toxicity criteria

NUT = Essential nutrient

## COMPARISON OF CHEMICAL CONCENTRATIONS TO SCREENING CRITERIA FOR MIGRATION FROM SURFACE SOIL TO GROUNDWATER - NORTH WATERFRONT FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND PAGE 3 OF 3

CAS Number	Chemical	Minimum Concentration <sup>(1)</sup>	Maximum Concentration <sup>(1)</sup>	Units	Sample of Maximum Concentration	Frequency of Detection	Range of Nondetects <sup>(2)</sup>	Concentration Used for Screening <sup>(3)</sup>		USEPA RSL Migration from Soil to Groundwater <sup>(5)</sup>		Exceeds Screening Criteria?
---------------	----------	---	---	-------	------------------------------------	------------------------------	---------------------------------------	---	--	---	--	-----------------------------------

### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012.
- 6 Rhode Island Department of Environmental Management, DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Value is for acenaphthene.
- 9 Value is for pyrene.
- 10 Value is for chlordane.
- 11 Value is for hexavalent chromium.
- 12 Value is MCL based soil screening level.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria.

### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.
- 9 Value is for acenaphthene.
- 10 Value is for pyrene.
- 11 Value is for chlordane.
- 12 Value is for hexavalent chromium.
- 13 Value is for mercuric chloride (and other mercury salts).
- 14 Value is for dibutylin and tributyltin.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

### **Definitions:**

C = Carcinogen

COPC = Chemical Of Potential Concern

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

### **Rationale Codes:**

For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:

BKG = Within Background Levels

BSL = Below COPC Screening Level

NTX = No toxicity criteria

NUT = Essential nutrient

## Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- $\ensuremath{\mathtt{3}}$  The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, June 2011.
- 6 Rhode Island Department of Environmental Management, DEM-DSR-01-93, February 2004.
- 7 Value is for acenaphthene.
- 8 Value is for pyrene.
- 9 Value is for chlordane.
- 10 Value is for hexavalent chromium.
- 11 Value is MCL based soil screening level.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria.

## Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 No background data is available for groundwater.
- 5 USEPA Regional Screening Level (RSL). The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag), May 2012.
- 6 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 7 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented. Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

## **Associated Samples**

## **Definitions:**

ARAR/TBC = Applicable or Relevant and Appropriate Requirements To Be Considered

C = Carcinogen

CAS = Chemical Abstracts Service

COPC = Chemical Of Potential Concern

EPA-MCL = US Environmental Protection Agency Maximum Contaminant Level (USEPA, 2012)

EPA-SDWR = US Environmental Protection Agency Secondary Drinking Water Regulation (USEPA, 2012)

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

RIDEM = Rhode Island Department of Environmental Management GA Groundwater Objective (November, 2011).

## **Rationale Codes:**

For selection as a COPC:

ASL = Above Screening Level/ARAR/TBC

For elimination as a COPC:

BSL = Below COPC Screening Level

NTX = No toxicity criteria

NUT = Essential nutrient

## OCCURRENCE, DISTRIBUTION, AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - VAPOR INTRUSION (GROUNDWATER TO INDOOR AIR) - NORTH WATERFRONT FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

PAGE 2 OF 2

## Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 No background data is available for groundwater.
- 5 USEPA Vapor Intrusion Screening Level (VISL) Calculator, Version 2.0. May 2012 RSLs.
- Values correspond to a target cancer risk level of 1E-6 or HI = 0.1 and an attenuation factor of 0.001.
- 6 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 7 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

## **Definitions:**

ARAR/TBC = Applicable or Relevant and Appropriate Requirements To Be Considered C = Carcinogen

CAS = Chemical Abstracts Service COPC = Chemical Of Potential Concern J = Estimated value

NA = Not Applicable/Not Available

## **Rationale Codes:**

For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:

BSL = Below COPC Screening Level

NTX = No toxicity criteria NUT = Essential nutrient

NVT = Not sufficiently volatile and/or toxic to pose inhalation risk.

### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Value is for pyrene.
- 9 Value is for hexavalent chromium.
- 10 Value is for mercuric chloride (and other mercury salts).
- 11 Value is for dibutylin and tributyltin.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

## **Associated Samples**

DSY-S-MW05-SS01

DSY-S-MW05-SS01-D

DSY-S-MW07-0001

DSY-S-TP11-0001

DSY-S-TP12-0001

DSY-S-TP15-0001 DSY-S-TP17-0001

## **Definitions:**

C = Carcinogen

COPC = Chemical Of Potential Concern

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

## **Rationale Codes:**

For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:

BKG = Within Background Levels

BSL = Below COPC Screening Level

NTX = No toxicity criteria

NUT = Essential nutrient

### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Value is for acenaphthene.
- 9 Value is for pyrene.
- 10 Value is for hexavalent chromium.
- 11 Value is for mercuric chloride (and other mercury salts).
- 12 Value is for dibutylin and tributyltin.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

## **Definitions:**

C = Carcinogen

COPC = Chemical Of Potential Concern

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

### **Rationale Codes:**

For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:

BKG = Within Background Levels

BSL = Below COPC Screening Level

NTX = No toxicity criteria

NUT = Essential nutrient

DSY-S-TP25-0507 DSY-S-TP25-1011

## Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012.
- 6 Rhode Island Department of Environmental Management, DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Value is for acenaphthene.
- 9 Value is for pyrene.
- 10 Value is for hexavalent chromium.
- 11 Value is MCL based soil screening level.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria.

#### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 No background data is available for groundwater.
- 5 USEPA Regional Screening Level (RSL). The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag), May 2012.
- 6 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

## **Associated Samples**

DSY-A-MW05-01 DSY-A-MW07-01 DSY-GW-MW218-030111 DSY-GW-MW219-031611-D DSY-GW-MW219-031611-AVG

### **Definitions:**

ARAR/TBC = Applicable or Relevant and Appropriate Requirements To Be Considered

C = Carcinogen

CAS = Chemical Abstracts Service

COPC = Chemical Of Potential Concern

EPA-MCL = US Environmental Protection Agency Maximum Contaminant Level (USEPA, 2012)

EPA-SDWR = US Environmental Protection Agency Secondary Drinking Water Regulation (USEPA, 2012)

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

RIDEM = Rhode Island Department of Environmental Management GA Groundwater Objective (November, 2011).

## **Rationale Codes:**

For selection as a COPC:

ASL = Above Screening Level/ARAR/TBC

For elimination as a COPC:

BSL = Below COPC Screening Level

NTX = No toxicity criteria

NUT = Essential nutrient

## OCCURRENCE, DISTRIBUTION, AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - VAPOR INTRUSION (GROUNDWATER TO INDOOR AIR) - CENTRAL SHIPYARD FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

---------------	----------	---	--------------------------------------	-------	------------------------------------	------------------------------	---------------------------------------	---	--	--	-----------------------	---------------------------------	--------------	---

#### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 No background data is available for groundwater.
- 5 USEPA Vapor Intrusion Screening Level (VISL) Calculator, Version 2.0. May 2012 RSLs. Values correspond to a target cancer risk level of 1E-6 or HI = 0.1 and an attenuation factor of 0.001.
- 6 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

## **Associated Samples**

DSY-A-MW05-01 DSY-A-MW07-01 DSY-GW-MW218-030111 DSY-GW-MW219-031611 DSY-GW-MW219-031611-D

## Definitions:

 ${\sf ARAR/TBC} = {\sf Applicable} \ \ {\sf or} \ \ {\sf Relevant} \ \ {\sf and} \ \ {\sf Appropriate} \ \ {\sf Requirements} \ \ {\sf To} \ \ {\sf Be} \ \ {\sf Considered}$ 

C = Carcinogen

CAS = Chemical Abstracts Service

COPC = Chemical Of Potential Concern

J = Estimated value

NA = Not Applicable/Not Available

## **Rationale Codes:**

For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:

BSL = Below COPC Screening Level

NTX = No toxicity criteria

NUT = Essential nutrient

NVT = Not sufficiently volatile and/or toxic to pose inhalation risk.

#### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Value is for pyrene.
- 9 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.
- 10 Value is for chlordane.
- 11 Value is for hexavalent chromium.
- 12 Value is for mercuric chloride (and other mercury salts).
- 13 Value is for dibutylin and tributyltin.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

## Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012.
- 6 Rhode Island Department of Environmental Management, DEM-DSR-01-93, November 2011.
- 7 Value is for pyrene.
- 8 Value is for chlordane.
- 9 Value is for hexavalent chromium.
- 10 Value is MCL based soil screening level.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria.

#### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.
- 9 Value is for pyrene.
- 10 Value is for hexavalent chromium.
- 11 Value is for mercuric chloride (and other mercury salts).
- 12 Value is for dibutylin and tributyltin.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

## **Associated Samples**

## **Definitions:**

C = Carcinogen

COPC = Chemical Of Potential Concern

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

## **Rationale Codes:**

For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:

BKG = Within Background Levels

BSL = Below COPC Screening Level

NTX = No toxicity criteria

NUT = Essential nutrient

## Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012.
- 6 Rhode Island Department of Environmental Management, DEM-DSR-01-93, November 2011.
- 7 Value is for pyrene.
- 8 Value is for hexavalent chromium.
- 9 Value is MCL based soil screening level.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria.

#### Footnotes

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 No background data is available for groundwater.
- 5 USEPA Regional Screening Level (RSL). The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag), May 2012.
- 6 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 7 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

## **Definitions:**

ARAR/TBC = Applicable or Relevant and Appropriate Requirements To Be Considered

C = Carcinogen

CAS = Chemical Abstracts Service

COPC = Chemical Of Potential Concern

EPA-MCL = US Environmental Protection Agency Maximum Contaminant Level (USEPA, 2012)

EPA-SDWR = US Environmental Protection Agency Secondary Drinking Water Regulation (USEPA, 2012)

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

RIDEM = Rhode Island Department of Environmental Management GA Groundwater Objective (February, 2004).

## OCCURRENCE, DISTRIBUTION, AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - VAPOR INTRUSION (GROUNDWATER TO INDOOR AIR) - FORMER BUILDING 234 FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

PAGE 2 OF 2

## Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 No background data is available for groundwater.
- 5 USEPA Vapor Intrusion Screening Level (VISL) Calculator, Version 2.0. May 2012 RSLs. Values correspond to a target cancer risk level of 1E-6 or HI = 0.1 and an attenuation factor of 0.001.
- 6 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 7 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

## **Associated Samples**

DSY-A-MW08-01 DSY-A-MW08-01-D DSY-A-MW09-01 DSY-A-MW104-01 DSY-GW-MW08-030111

## **Definitions:**

ARAR/TBC = Applicable or Relevant and Appropriate Requirements To Be Considered C = Carcinogen
CAS = Chemical Abstracts Service
COPC = Chemical Of Potential Concern
J = Estimated value
NA = Not Applicable/Not Available

## Rationale Codes:

## For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:
BKG = Within Background Levels
BSL = Below COPC Screening Level
NTX = No toxicity criteria
NUT = Essential nutrient

#### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Value is for hexavalent chromium.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

#### **Associated Samples**

 DSY-SB201-SO-0204
 DSY-S-TP02-1516

 DSY-SB202-SO-0204
 DSY-S-TP05-1213

 DSY-S-TP01-1112
 DSY-S-TP06-1213

#### **Definitions:**

C = Carcinogen

COPC = Chemical Of Potential Concern

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

#### **Rationale Codes:**

For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:

BKG = Within Background Levels

BSL = Below COPC Screening Level

NTX = No toxicity criteria

NUT = Essential nutrient

### OCCURRENCE, DISTRIBUTION, AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - DIRECT CONTACT WITH SURFACE SOIL - PCB REMOVAL AREA FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

#### PAGE 2 OF 2

#### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Value is for acenaphthene.
- 9 Value is for pyrene.
- 10 Value is for hexavalent chromium.
- 11 Value is for mercuric chloride (and other mercury salts).

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

DSY-SO-SB217-000.5 DSY-SO-SB224-000.5

DSY-SO-SB224-000.5-D

B6-S1

#### **Definitions:**

C = Carcinogen

COPC = Chemical Of Potential Concern

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

#### **Rationale Codes:**

For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:

BKG = Within Background Levels

BSL = Below COPC Screening Level

NTX = No toxicity criteria

NUT = Essential nutrient

---------------	----------	---	---	-------	------------------------------------	------------------------------	---------------------------------------	---	--	--	---	--------------	---	--

#### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Value is for acenaphthene.
- 9 Value is for pyrene.
- 10 Value is for hexavalent chromium.
- 11 Value is for mercuric chloride (and other mercury salts).

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

#### **Associated Samples**

DSY-S-MW06-0406

DSY-SO-SB210-0102

DSY-SO-SB211-0102

DSY-SO-SB212-0204

DSY-SO-SB213-0203

DSY-SO-SB214-0203

B6-S6

#### Definitions:

C = Carcinogen

COPC = Chemical Of Potential Concern

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

#### **Rationale Codes:**

For selection as a COPC:

ASL = Above Screening Level and site background.

For elimination as a COPC:

BKG = Within Background Levels

BSL = Below COPC Screening Level

NTX = No toxicity criteria

NUT = Essential nutrient

					Adult	Inhalation	Quant	this scenario is included to aid in future risk management decisions.
Future	Groundwater	Groundwater	Derecktor Shipyard	Industrial Worker	Adult	Ingestion Dermal	Quant Quant	Future industrial workers may be exposed to groundwater if groundwater was used as a water supply.
				Construction Workers	Adult	Inhalation	Quant	Construction workers may be exposed to COPCs that have volatilized from groundwater during excavation activities.
				Trespassers	Adolescents	Ingestion	None	
				Users		Dermal	None	Future trespassers are not expected to be exposed to groundwater.
					Adult	Ingestion Dermal	None None	
				Residents	Child	Ingestion	Quant	
				Nesidents	Offilia	Dermal	Quant	Although a future residential scenario is considered unlikely at the site
					Adult	Ingestion	Quant	this scenario is included to aid in future risk management decisions.
						Dermal	Quant	
		Air	Derecktor Shipyard	Industrial Worker	Adult	Inhalation	None	Future industrial workers are not exposed to be exposed to COPCs that have volatilized from groundwater.
				Construction Workers	Adult	Inhalation	Quant	Construction workers may be exposed to COPCs that have volatilized from groundwater during excavation activities.
				Trespassers	Adolescents	Inhalation	None	
					Adult	Inhalation	None Future trespassers are not expected to be exposed to groundwater.	Future trespassers are not expected to be exposed to groundwater.

## TABLE 5-30 SELECTION OF EXPOSURE PATHWAYS FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND PAGE 4 OF 4

Scenario Timeframe	Medium	Exposure Medium	Exposure Point	Receptor Population	Receptor Age	Exposure Route	Type of Analysis	Rationale for Selection or Exclusion of Exposure Pathway	
Future	Groundwater	Air	Derecktor Shipyard	Residents	Child	Inhalation	Quant	Although a future residential scenario is considered unlikely at the site	
					Adult	Inhalation	Quant		
			Vapor Intrusion	Industrial Worker	Adult	Inhalation	Qual	Future industrial workers could be exposed to COPCs that have volatilized from groundwater and migrated through building foundations and into indoor air.	
				Residents	Child	Inhalation	Qual	0 0	
					Adult	Inhalation	Qual	migrated through building foundations and into indoor air.	

Notes:

Qual - Qualitative.

Quant - Quantitative.

## TABLE 5-31 RECEPTORS AND EXPOSURE ROUTES FOR QUANTITATIVE EVALUATION FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

Receptors	Exposure Routes
Industrial Worker	Soil incidental ingestion
(current/future land use)	Soil dermal contact
	Inhalation of air/dust emissions
	Direct ingestion of groundwater
	Groundwater dermal contact
Construction Workers	Soil incidental ingestion
(current/future land use)	Soil dermal contact
	Inhalation of air/dust emissions
	Groundwater incidental ingestion (during excavation)
	Groundwater dermal contact (during excavation)
	Groundwater inhalation of volatile organics (during excavation)
Trespassers (Adolescent/Adults)	Soil incidental ingestion
(current/future land use)	Soil dermal contact
	Inhalation of air/dust emissions
Hypothetical Residents (Children/Adult)	Soil incidental ingestion
(future land use)	Soil dermal contact
	Inhalation of air/dust emissions
	Direct ingestion of groundwater
	Groundwater dermal contact (showering/bathing)
	Inhalation of volatiles in groundwater (showering/bathing)

#### Notes:

Appendix F.1 lists the samples that were used to calculate the EPCs.

NA - Not applicable. Not a COPC for this media.

ND-GW - Not detected in 2011 groundwater samples.

ND-Soil - Not detected in soil samples collected in the unpaved area in the Central Shipyard.

- 1 Maximum Detected Concentration
- 2 95% KM (t)
- 3 95% KM (BCA) 4 95% KM (Chebyshev) 5 95% Student's-t

- 6 95% Approximate Gamma 7 95% KM (Percentile Bootstrap)
- 8 Average Concentration 9 95% Modified-t

#### Notes

All values from EPA's Risk Assessment Guidance for Superfund Volume 1: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment) Final, July 2004.

- 1 T(event) is 8 hrs for the construction worker; 0.5 hr for industrial workers, 1 hr for RME for hypothetical child residents; and 0.58 hrs for hypothetical adult residents.
- 2 RAGS Part E recommends not attempting to quantify risk because contaminants are outside the effective predictive domain of the model.

FA = Fraction Absorbed Water

Kp = Dermal Permeability Coefficient of Compound in Water

T(event) = Event Duration

Tau = Lag Time

T\* = Time to Reach Steady-State

B = Dimensionless Ratio of the Permeability Coefficient of a Compound Through the Stratum Corneum Relative to its Permeability Coefficient Across the Viable Epidermis

NA = Not applicable.

## TABLE 5-36 NON-CANCER TOXICITY DATA -- ORAL/DERMAL FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND PAGE 2 OF 2

#### Notes:

1 - U.S. EPA, 2004: Risk Assessment Guidance for Superfund (Part E, Supplemental Guidance for Dermal Risk Assessment) Interim. EPA/540/R/99/005.

- 2 Adjusted dermal RfD = Oral RfD x Oral Absorption Efficiency for Dermal.
- 3 Pyrene is used as a surrogate for benzo(g,h,i)perylene.
- 4 Values are for hexavalent chromium.
- 5 Adjusted IRIS value in accordance with IRIS.

Site Name: Newport NS - Site 19 - On-Shore Derecktor Shipyard

Project No: 112G02125.SA.DM (ED00000152)

Sample ID: DSY-SG-MW12-0506 Lead Sampler: Miki Alroy Location ID: DSY-SG12 Additional Sampler(s) N/A QC Duplicate ID: N/A MS/MSD: NA

Sample Data											
Sampling Source	None	Sampling Type	None								
Top Depth of Probe (ft-bgs)	0	Type of Probe	None								
Bottom Depth of Probe(ft-bgs)	0	Diameter of Probe (in)	None								

Equipment										
Gauge	Yes	Gauge Serial Number	35150							
Sample Canister	Yes	Sample Canister Serial Number	35150							
Sample Canister Model Number	2303	Sample Canister Leak Check Date	02/22/11							

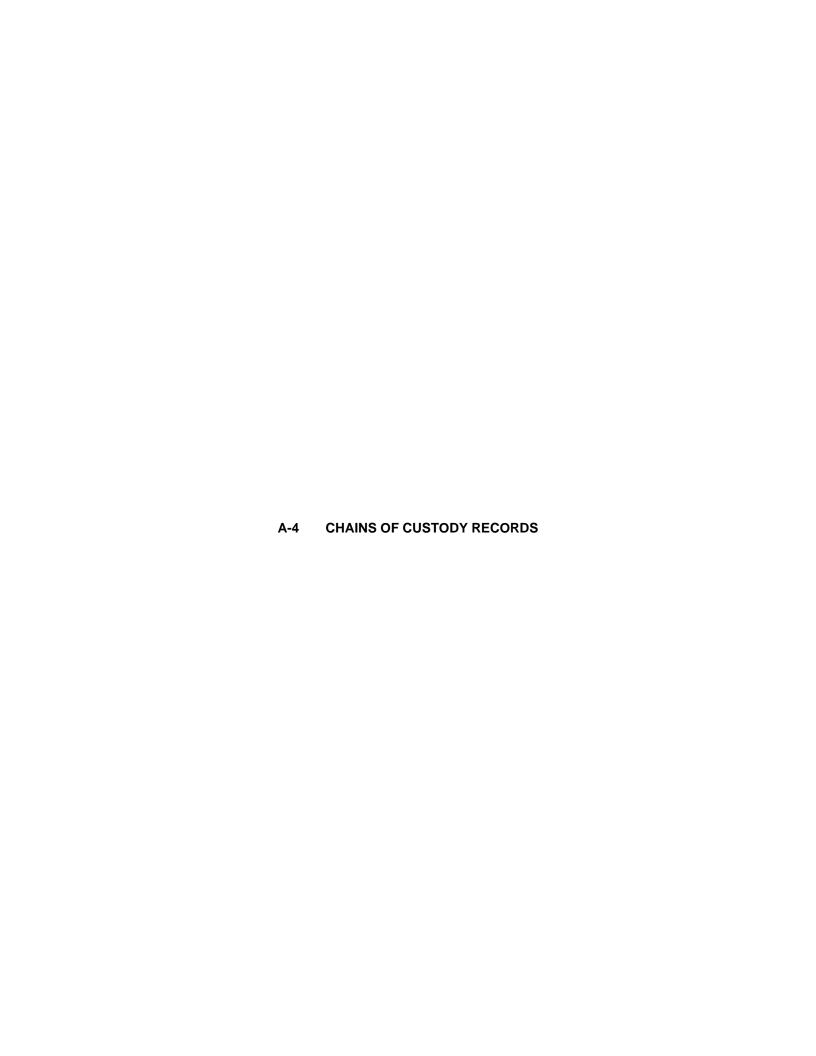

Leak Test											
Leak Test Start Date	03/03/2011	Leak Test Start Time	14:00								
Leak Test End Date	03/03/2011	Leak Test End Time	14:15								
Leak Test Duration (min)	15	Leak Test Volume (L)	3								
Leak Flow Rate (mL/min)	200.00	Results of Leak Test (ppm-He)	900								

Sample P	Sample Purge Information												
Date	Time	PID Reading (ppm)	Pressure (in-Hg)	Method	Temp (°C)	Other	Notes						
03/03/11	15:19	NA	-28	Low-flow air pump w/Helium leak test		N/A	None						
03/03/11	15:29	NA	-22	Low-flow air pump w/Helium leak test		N/A	None						
03/03/11	15:39	NA	-13	Low-flow air pump w/Helium leak test	-3	N/A	None						
03/03/11	15:49	NA	-7	Low-flow air pump w/Helium leak test		N/A	None						

<b>Final Purge</b>	Final Purge / Sample Data												
Start Sample Collection (hrs)	End Sample Collection (hrs)	Sample Collection Duration (min)	Sample Collection Volume (L)	Sample Collection Flow Rate (mL/min)	Method	PID Reading (ppm)	Pressure (in Hg)	Temp (°C)	Other				
15:19	15:49	30.0	6	200.0	Low-flow air pump w/Helium leak test		-7	-3	N/A				

Labo	aboratory Analysis												
Coll.	Date	Time	Description	Analysis	Preservative	No.	Туре	Vol.	COC Notes	Chain No.			
<b>~</b>	03/03/11	15:19	VOCs	TO-15	None	1	SUMMA Canister	6 L	None	ED00000152-5			

General Notes	
None

#### **General Notes**

Initial sounding of monitoring well MW-03 indicated a hard bottom @ 17.83' below top of casing. PVC to far down inb well to measure accuratly.

#### **General Notes**

Amy Carey is the developer.
Based on experience developing new wells 02A and 220, a surge block was not used here. Very silty, sandy water comes up with the foot-valve and a surge block creates so much it starts to fill in the well.
Well had some amount of silt on the bottom when first started purging (soft).

#### **USE OF TERMS**

Equipment blank: The equipment blank shall include the pump and the pump's tubing. If tubing is dedicated to the well, the equipment blank needs only to include the pump in subsequent sampling rounds. If the pump and tubing are dedicated to the well, the equipment blank is collected prior to its placement in the well. If the pump and tubing will be used to sample multiple wells, the equipment blank is normally collected after sampling from contaminated wells and not after background wells.

<u>Field duplicates</u>: Field duplicates are collected to determine precision of the sampling procedure. For this procedure, collect duplicate for each analyte group in consecutive order (VOC original, VOC duplicate, SVOC original, SVOC duplicate, etc.).

<u>Indicator field parameters</u>: This SOP uses field measurements of turbidity, dissolved oxygen, specific conductance, temperature, pH, and oxidation/reduction potential (ORP) as indicators of when purging operations are sufficient and sample collection may begin.

Matrix Spike/Matrix Spike Duplicates: Used by the laboratory in its quality assurance program. Consult the laboratory for the sample volume to be collected.

<u>Poteniometric Surface</u>: The level to which water rises in a tightly cased well constructed in a confined aquifer. In an unconfined aquifer, the potentiometric surface is the water table.

**QAPP**: Quality Assurance Project Plan

SAP: Sampling and Analysis Plan

SOP: Standard operating procedure

<u>Stabilization</u>: A condition that is achieved when all indicator field parameter measurements are sufficiently stable (as described in the "Monitoring Indicator Field Parameters" section) to allow sample collection to begin.

<u>Temperature blank</u>: A temperature blank is added to each sample cooler. The blank is measured upon receipt at the laboratory to assess whether the samples were properly cooled during transit.

<u>Trip blank (VOCs)</u>: Trip blank is a sample of analyte-free water taken to the sampling site and returned to the laboratory. The trip blanks (one pair) are added to each sample cooler that contains VOC samples.

#### **SCOPE & APPLICATION**

The goal of this groundwater sampling procedure is to collect water samples that reflect the total mobile organic and inorganic loads (dissolved and colloidal sized fractions) transported through the subsurface under ambient flow conditions, with minimal physical and chemical alterations from sampling operations. This standard operating procedure (SOP) for collecting groundwater samples will help ensure that the project's data quality objectives (DQOs) are met under certain low-flow conditions.

The SOP emphasizes the need to minimize hydraulic stress at the well-aquifer interface by maintaining low water-level drawdowns, and by using low pumping rates during purging and sampling operations. Indicator field parameters (e.g., dissolved oxygen, pH, etc.) are monitored during purging in order to determine when sample collection may begin. Samples properly collected using this SOP are suitable for analysis of groundwater contaminants (volatile and semi-volatile organic analytes, dissolved gases, pesticides, PCBs, metals and other inorganics), or naturally occurring analytes. This SOP is based on Puls, and Barcelona (1996).

This procedure is designed for monitoring wells with an inside diameter (1.5-inches or greater) that can accommodate a positive lift pump with a screen length or open interval ten feet or less and with a water level above the top of the screen or open interval (Hereafter, the "screen or open interval" will be referred to only as "screen interval"). This SOP is not applicable to other well-sampling conditions.

While the use of dedicated sampling equipment is not mandatory, dedicated pumps and tubing can reduce sampling costs significantly by streamlining sampling activities and thereby reducing the overall field costs.

The goal of this procedure is to emphasize the need for consistency in deploying and operating equipment while purging and sampling monitoring wells during each sampling event. This will help to minimize sampling variability.

This procedure describes a general framework for groundwater sampling. Other site specific information (hydrogeological context, conceptual site model (CSM), DQOs, etc.) coupled with systematic planning must be added to the procedure in order to develop an appropriate site specific SAP/QAPP. In addition, the site specific SAP/QAPP must identify the specific equipment that will be used to collect the groundwater samples.

This procedure does not address the collection of water or free product samples from wells containing free phase LNAPLs and/or DNAPLs (light or dense non-aqueous phase

liquids). For this type of situation, the reader may wish to check: Cohen, and Mercer (1993) or other pertinent documents.

This SOP is to be used when collecting groundwater samples from monitoring wells at all Superfund, Federal Facility and RCRA sites in Region 1 under the conditions described herein. Request for modification of this SOP, in order to better address specific situations at individual wells, must include adequate technical justification for proposed changes. All changes and modifications must be approved and included in a revised SAP/QAPP before implementation in field.

#### BACKGROUND FOR IMPLEMENTATION

It is expected that the monitoring well screen has been properly located (both laterally and vertically) to intercept existing contaminant plume(s) or along flow paths of potential contaminant migration. Problems with inappropriate monitoring well placement or faulty/improper well installation cannot be overcome by even the best water sampling procedures. This SOP presumes that the analytes of interest are moving (or will potentially move) primarily through the more permeable zones intercepted by the screen interval.

Proper well construction, development, and operation and maintenance cannot be overemphasized. The use of installation techniques that are appropriate to the hydrogeologic setting of the site often prevent "problem well" situations from occurring. During well development, or redevelopment, tests should be conducted to determine the hydraulic characteristics of the monitoring well. The data can then be used to set the purging/sampling rate, and provide a baseline for evaluating changes in well performance and the potential need for well rehabilitation. Note: if this installation data or well history (construction and sampling) is not available or discoverable, for all wells to be sampled, efforts to build a sampling history should commence with the next sampling event.

The pump intake should be located within the screen interval and at a depth that will remain under water at all times. It is recommended that the intake depth and pumping rate remain the same for all sampling events. The mid-point or the lowest historical midpoint of the saturated screen length is often used as the location of the pump intake. For new wells, or for wells without pump intake depth information, the site's SAP/QAPP must provide clear reasons and instructions on how the pump intake depth(s) will be selected, and reason(s) for the depth(s) selected. If the depths to top and bottom of the well screen are not known, the SAP/QAPP will need to describe how the sampling depth will be determined and how the data can be used.

Stabilization of indicator field parameters is used to indicate that conditions are suitable for sampling to begin. Achievement of turbidity levels of less than 5 NTU, and stable drawdowns of less than 0.3 feet, while desirable, are not mandatory. Sample collection

may still take place provided the indicator field parameter criteria in this procedure are met. If after 2 hours of purging indicator field parameters have not stabilized, one of three optional courses of action may be taken: a) continue purging until stabilization is achieved, b) discontinue purging, do not collect any samples, and record in log book that stabilization could not be achieved (documentation must describe attempts to achieve stabilization), c) discontinue purging, collect samples and provide full explanation of attempts to achieve stabilization (note: there is a risk that the analytical data obtained, especially metals and strongly hydrophobic organic analytes, may reflect a sampling bias and therefore, the data may not meet the data quality objectives of the sampling event).

It is recommended that low-flow sampling be conducted when the air temperature is above 32°F (0°C). If the procedure is used below 32°F, special precautions will need to be taken to prevent the groundwater from freezing in the equipment. Because sampling during freezing temperatures may adversely impact the data quality objectives, the need for water sample collection during months when these conditions are likely to occur should be evaluated during site planning and special sampling measures may need to be developed. Ice formation in the flow-through-cell will cause the monitoring probes to act erratically. A transparent flow-through-cell needs to be used to observe if ice is forming in the cell. If ice starts to form on the other pieces of the sampling equipment, additional problems may occur.

#### **HEALTH & SAFETY**

When working on-site, comply with all applicable OSHA requirements and the site's health/safety procedures. All proper personal protection clothing and equipment are to be worn. Some samples may contain biological and chemical hazards. These samples should be handled with suitable protection to skin, eyes, etc.

#### **CAUTIONS**

The following cautions need to be considered when planning to collect groundwater samples when the below conditions occur.

If the groundwater degasses during purging of the monitoring well, dissolved gases and VOCs will be lost. When this happens, the groundwater data for dissolved gases (e.g., methane, ethene, ethane, dissolved oxygen, etc.) and VOCs will need to be qualified. Some conditions that can promote degassing are the use of a vacuum pump (e.g., peristaltic pumps), changes in aperture along the sampling tubing, and squeezing/pinching the pump's tubing which results in a pressure change.

When collecting the samples for dissolved gases and VOCs analyses, avoid aerating the groundwater in the pump's tubing. This can cause loss of the dissolved gases and VOCs in

the groundwater. Having the pump's tubing completely filled prior to sampling will avoid this problem when using a centrifugal pump or peristaltic pump.

Direct sun light and hot ambient air temperatures may cause the groundwater in the tubing and flow-through-cell to heat up. This may cause the groundwater to degas which will result in loss of VOCs and dissolved gases. When sampling under these conditions, the sampler will need to shade the equipment from the sunlight (e.g., umbrella, tent, etc.). If possible, sampling on hot days, or during the hottest time of the day, should be avoided. The tubing exiting the monitoring well should be kept as short as possible to avoid the sun light or ambient air from heating up the groundwater.

Thermal currents in the monitoring well may cause vertical mixing of water in the well bore. When the air temperature is colder than the groundwater temperature, it can cool the top of the water column. Colder water which is denser than warm water sinks to the bottom of the well and the warmer water at the bottom of the well rises, setting up a convention cell. "During low-flow sampling, the pumped water may be a mixture of convecting water from within the well casing and aquifer water moving inward through the screen. This mixing of water during low-flow sampling can substantially increase equilibration times, can cause false stabilization of indicator parameters, can give false indication of redox state, and can provide biological data that are not representative of the aquifer conditions" (Vroblesky 2007).

Failure to calibrate or perform proper maintenance on the sampling equipment and measurement instruments (e.g., dissolved oxygen meter, etc.) can result in faulty data being collected.

Interferences may result from using contaminated equipment, cleaning materials, sample containers, or uncontrolled ambient/surrounding air conditions (e.g., truck/vehicle exhaust nearby).

Cross contamination problems can be eliminated or minimized through the use of dedicated sampling equipment and/or proper planning to avoid ambient air interferences. Note that the use of dedicated sampling equipment can also significantly reduce the time needed to complete each sampling event, will promote consistency in the sampling, and may reduce sampling bias by having the pump's intake at a constant depth.

Clean and decontaminate all sampling equipment prior to use. All sampling equipment needs to be routinely checked to be free from contaminants and equipment blanks collected to ensure that the equipment is free of contaminants. Check the previous equipment blank data for the site (if they exist) to determine if the previous cleaning procedure removed the contaminants. If contaminants were detected and they are a concern, then a more vigorous cleaning procedure will be needed.

#### PERSONNEL QUALIFICATIONS

All field samplers working at sites containing hazardous waste must meet the requirements of the OSHA regulations. OSHA regulations may require the sampler to take the 40 hour OSHA health and safety training course and a refresher course prior to engaging in any field activities, depending upon the site and field conditions.

The field samplers must be trained prior to the use of the sampling equipment, field instruments, and procedures. Training is to be conducted by an experienced sampler before initiating any sampling procedure.

The entire sampling team needs to read, and be familiar with, the site Health and Safety Plan, all relevant SOPs, and SAP/QAPP (and the most recent amendments) before going onsite for the sampling event. It is recommended that the field sampling leader attest to the understanding of these site documents and that it is recorded.

#### **EQUIPMENT AND SUPPLIES**

#### A. Informational materials for sampling event

A copy of the current Health and Safety Plan, SAP/QAPP, monitoring well construction data, location map(s), field data from last sampling event, manuals for sampling, and the monitoring instruments' operation, maintenance, and calibration manuals should be brought to the site.

#### B. Well keys.

#### C. Extraction device

Adjustable rate, submersible pumps (e.g., centrifugal, bladder, etc.) which are constructed of stainless steel or Teflon are preferred. Note: if extraction devices constructed of other materials are to be used, adequate information must be provided to show that the substituted materials do not leach contaminants nor cause interferences to the analytical procedures to be used. Acceptance of these materials must be obtained before the sampling event.

If bladder pumps are selected for the collection of VOCs and dissolved gases, the pump setting should be set so that one pulse will deliver a water volume that is sufficient to fill a 40 mL VOC vial. This is not mandatory, but is considered a "best practice". For the proper operation, the bladder pump will need a minimum amount of water above the pump; consult the manufacturer for the recommended submergence. The pump's recommended submergence value should be determined during the planning stage, since it may influence well construction and placement of dedicated pumps where water-level fluctuations are significant.

Adjustable rate, peristaltic pumps (suction) are to be used with caution when collecting samples for VOCs and dissolved gases (e.g., methane, carbon dioxide, etc.) analyses. Additional information on the use of peristaltic pumps can be found in Appendix A. If peristaltic pumps are used, the inside diameter of the rotor head tubing needs to match the inside diameter of the tubing installed in the monitoring well.

Inertial pumping devices (motor driven or manual) are not recommended. These devices frequently cause greater disturbance during purging and sampling, and are less easily controlled than submersible pumps (potentially increasing turbidity and sampling variability, etc.). This can lead to sampling results that are adversely affected by purging and sampling operations, and a higher degree of data variability.

#### D. Tubing

Teflon or Teflon-lined polyethylene tubing are preferred when sampling is to include VOCs, SVOCs, pesticides, PCBs and inorganics. Note: if tubing constructed of other materials is to be used, adequate information must be provided to show that the substituted materials do not leach contaminants nor cause interferences to the analytical procedures to be used. Acceptance of these materials must be obtained before the sampling event.

PVC, polypropylene or polyethylene tubing may be used when collecting samples for metal and other inorganics analyses.

The use of 1/4 inch or 3/8 inch (inside diameter) tubing is recommended. This will help ensure that the tubing remains liquid filled when operating at very low pumping rates when using centrifugal and peristaltic pumps.

Silastic tubing should be used for the section around the rotor head of a peristaltic pump. It should be less than a foot in length. The inside diameter of the tubing used at the pump rotor head must be the same as the inside diameter of tubing placed in the well. A tubing connector is used to connect the pump rotor head tubing to the well tubing. Alternatively, the two pieces of tubing can be connected to each other by placing the one end of the tubing inside the end of the other tubing. The tubing must not be reused.

Page 11 of 30

#### E. The water level measuring device

Electronic "tape", pressure transducer, water level sounder/level indicator, etc. should be capable of measuring to 0.01 foot accuracy. Recording pressure transducers, mounted above the pump, are especially helpful in tracking water levels during pumping operations, but their use must include check measurements with a water level "tape" at the start and end of each sampling event.

#### F. Flow measurement supplies

Graduated cylinder (size according to flow rate) and stopwatch usually will suffice.

Large graduated bucket used to record total water purged from the well.

#### G. Interface probe

To be used to check on the presence of free phase liquids (LNAPL, or DNAPL) before purging begins (as needed).

#### H. Power source (generator, nitrogen tank, battery, etc.)

When a gasoline generator is used, locate it downwind and at least 30 feet from the well so that the exhaust fumes do not contaminate samples.

#### I. Indicator field parameter monitoring instruments

Use of a multi-parameter instrument capable of measuring pH, oxidation/reduction potential (ORP), dissolved oxygen (DO), specific conductance, temperature, and coupled with a flow-through-cell is required when measuring all indicator field parameters, except turbidity. Turbidity is collected using a separate instrument. Record equipment/instrument identification (manufacturer, and model number).

Transparent, small volume flow-through-cells (e.g., 250 mLs or less) are preferred. This allows observation of air bubbles and sediment buildup in the cell, which can interfere with the operation of the monitoring instrument probes, to be easily detected. A small volume cell facilitates rapid turnover of water in the cell between measurements of the indicator field parameters.

It is recommended to use a flow-through-cell and monitoring probes from the same manufacturer and model to avoid <u>incompatibility</u> between the probes and flow-through-cell.

Turbidity samples are collected before the flow-through-cell. A "T" connector coupled with a valve is connected between the pump's tubing and flow-through-cell. When a turbidity measurement is required, the valve is opened to allow the groundwater to flow into a container. The valve is closed and the container sample is then placed in the turbidimeter.

Standards are necessary to perform field calibration of instruments. A minimum of two standards are needed to bracket the instrument measurement range for all parameters except ORP which use a Zobell solution as a standard. For dissolved oxygen, a wet sponge used for the 100% saturation and a zero dissolved oxygen solution are used for the calibration.

Barometer (used in the calibration of the Dissolved Oxygen probe) and the conversion formula to convert the barometric pressure into the units of measure used by the Dissolved Oxygen meter are needed.

#### J. Decontamination supplies

Includes (for example) non-phosphate detergent, distilled/deionized water, isopropyl alcohol, etc.

#### K. Record keeping supplies

Logbook(s), well purging forms, chain-of-custody forms, field instrument calibration forms, etc.

#### L. Sample bottles

- M. Sample preservation supplies (as required by the analytical methods)
- N. Sample tags or labels

#### O. PID or FID instrument

If appropriate, to detect VOCs for health and safety purposes, and provide qualitative field evaluations.

#### P. Miscellaneous Equipment

Equipment to keep the sampling apparatus shaded in the summer (e.g., umbrella) and from freezing in the winter. If the pump's tubing is allowed to heat up in the warm weather, the cold groundwater may degas as it is warmed in the tubing.

#### **EQUIPMENT/INSTRUMENT CALIBRATION**

Prior to the sampling event, perform maintenance checks on the equipment and instruments according to the manufacturer's manual and/or applicable SOP. This will ensure that the equipment/instruments are working properly before they are used in the field.

Prior to sampling, the monitoring instruments must be calibrated and the calibration documented. The instruments are calibrated using U.S Environmental Protection Agency Region 1 Calibration of Field Instruments (temperature, pH, dissolved oxygen, conductivity/specific conductance, oxidation/reduction [ORP], and turbidity), January 19, 2010, or latest version or from one of the methods listed in 40CFR136, 40CFR141 and SW-846.

The instruments shall be calibrated at the beginning of each day. If the field measurement falls outside the calibration range, the instrument must be re-calibrated so that all measurements fall within the calibration range. At the end of each day, a calibration check is performed to verify that instruments remained in calibration throughout the day. This check is performed while the instrument is in measurement mode, not calibration mode. If the field instruments are being used to monitor the natural attenuation parameters, then a calibration check at mid-day is highly recommended to ensure that the instruments did not drift out of calibration. Note: during the day if the instrument reads zero or a negative number for dissolved oxygen, pH, specific conductance, or turbidity (negative value only), this indicates that the instrument drifted out of calibration or the instrument is malfunctioning. If this situation occurs the data from this instrument will need to be qualified or rejected.

#### PRELIMINARY SITE ACTIVITIES (as applicable)

Check the well for security (damage, evidence of tampering, missing lock, etc.) and record pertinent observations (include photograph as warranted).

If needed lay out sheet of clean polyethylene for monitoring and sampling equipment, unless equipment is elevated above the ground (e.g., on a table, etc.).

Page 14 of 30

Remove well cap and if appropriate measure VOCs at the rim of the well with a PID or FID instrument and record reading in field logbook or on the well purge form.

If the well casing does not have an established reference point (usually a V-cut or indelible mark in the well casing), make one. Describe its location and record the date of the mark in the logbook (consider a photographic record as well). All water level measurements must be recorded relative to this reference point (and the altitude of this point should be determined using techniques that are appropriate to site's DQOs.

If water-table or potentiometric surface map(s) are to be constructed for the sampling event, perform synoptic water level measurement round (in the shortest possible time) before any purging and sampling activities begin. If possible, measure water level depth (to 0.01 ft.) and total well depth (to 0.1 ft.) the day before sampling begins, in order to allow for re-settlement of any particulates in the water column. This is especially important for those wells that have not been recently sampled because sediment buildup in the well may require the well to be redeveloped. If measurement of total well depth is not made the day before, it should be measured after sampling of the well is complete. All measurements must be taken from the established referenced point. Care should be taken to minimize water column disturbance.

Check newly constructed wells for the presence of LNAPLs or DNAPLs before the initial sampling round. If none are encountered, subsequent check measurements with an interface probe may not be necessary unless analytical data or field analysis signal a worsening situation. This SOP cannot be used in the presence of LNAPLs or DNAPLs. If NAPLs are present, the project team must decide upon an alternate sampling method. All project modifications must be approved and documented prior to implementation.

If available check intake depth and drawdown information from previous sampling event(s) for each well. Duplicate, to the extent practicable, the intake depth and extraction rate (use final pump dial setting information) from previous event(s). If changes are made in the intake depth or extraction rate(s) used during previous sampling event(s), for either portable or dedicated extraction devices, record new values, and explain reasons for the changes in the field logbook.

#### PURGING AND SAMPLING PROCEDURE

Purging and sampling wells in order of increasing chemical concentrations (known or anticipated) are preferred.

The use of dedicated pumps is recommended to minimize artificial mobilization and entrainment of particulates each time the well is sampled. Note that the use of dedicated sampling equipment can also significantly reduce the time needed to complete each

Page 15 of 30

sampling event, will promote consistency in the sampling, and may reduce sampling bias by having the pump's intake at a constant depth.

#### A. Initial Water Level

Measure the water level in the well before installing the pump if a non-dedicated pump is being used. The initial water level is recorded on the purge form or in the field logbook.

#### B. Install Pump

Lower pump, safety cable, tubing and electrical lines slowly (to minimize disturbance) into the well to the appropriate depth (may not be the mid-point of the screen/open interval). The Sampling and Analysis Plan/Quality Assurance Project Plan should specify the sampling depth (used previously), or provide criteria for selection of intake depth for each new well. If possible keep the pump intake at least two feet above the bottom of the well, to minimize mobilization of particulates present in the bottom of the well.

Pump tubing lengths, above the top of well casing should be kept as short as possible to minimize heating the groundwater in the tubing by exposure to sun light and ambient air temperatures. Heating may cause the groundwater to degas, which is unacceptable for the collection of samples for VOC and dissolved gases analyses.

#### C. Measure Water Level

Before starting pump, measure water level. Install recording pressure transducer, if used to track drawdowns, to initialize starting condition.

#### D. Purge Well

From the time the pump starts purging and until the time the samples are collected, the purged water is discharged into a graduated bucket to determine the total volume of groundwater purged. This information is recorded on the purge form or in the field logbook.

Start the pump at low speed and slowly increase the speed until discharge occurs. Check water level. Check equipment for water leaks and if present fix or replace the affected equipment. Try to match pumping rate used during previous sampling event(s). Otherwise, adjust pump speed until there is little or no water level drawdown. If the minimal drawdown that can be achieved exceeds 0.3 feet, but remains stable, continue purging.

Monitor and record the water level and pumping rate every five minutes (or as appropriate) during purging. Record any pumping rate adjustments (both time and flow rate). Pumping rates should, as needed, be reduced to the minimum capabilities of the pump to ensure stabilization of the water level. Adjustments are best made in the first fifteen minutes of pumping in order to help minimize purging time. During pump start-up, drawdown may exceed the 0.3 feet target and then "recover" somewhat as pump flow adjustments are made. Purge volume calculations should utilize stabilized drawdown value, not the initial drawdown. If the initial water level is above the top of the screen do not allow the water level to fall into the well screen. The final purge volume must be greater than the stabilized drawdown volume plus the pump's tubing volume. If the drawdown has exceeded 0.3 feet and stabilizes, calculate the volume of water between the initial water level and the stabilized water level. Add the volume of the water which occupies the pump's tubing to this calculation. This combined volume of water needs to be purged from the well after the water level has stabilized before samples are collected.

Avoid the use of constriction devices on the tubing to decrease the flow rate because the constrictor will cause a pressure difference in the water column. This will cause the groundwater to degas and result in a loss of VOCs and dissolved gasses in the groundwater samples.

Note: the flow rate used to achieve a stable pumping level should remain constant while monitoring the indicator parameters for stabilization and while collecting the samples.

Wells with low recharge rates may require the use of special pumps capable of attaining very low pumping rates (e.g., bladder, peristaltic), and/or the use of dedicated equipment. For new monitoring wells, or wells where the following situation has not occurred before, if the recovery rate to the well is less than 50 mL/min., or the well is being essentially dewatered during purging, the well should be sampled as soon as the water level has recovered sufficiently to collect the volume needed for all anticipated samples. The project manager or field team leader will need to make the decision when samples should be collected, how the sample is to be collected, and the reasons recorded on the purge form or in the field logbook. A water level measurement needs to be performed and recorded before samples are collected. If the project manager decides to collect the samples using the pump, it is best during this recovery period that the pump intake tubing not be removed, since this will aggravate any turbidity problems. Samples in this specific situation may be collected without stabilization of indicator field parameters. Note that field conditions and efforts to overcome problematic situations must be recorded in order to support field decisions to deviate from normal procedures described in this SOP. If this type of problematic situation persists in a well, then water sample collection should be changed to a passive or no-purge method, if consistent with the site's DQOs, or have a new well installed.

#### E. Monitor Indicator Field Parameters

After the water level has stabilized, connect the "T" connector with a valve and the flow-through-cell to monitor the indicator field parameters. If excessive turbidity is anticipated or encountered with the pump startup, the well may be purged for a while without connecting up the flow-through-cell, in order to minimize particulate buildup in the cell (This is a judgment call made by the sampler). Water level drawdown measurements should be made as usual. If possible, the pump may be installed the day before purging to allow particulates that were disturbed during pump insertion to settle.

During well purging, monitor indicator field parameters (turbidity, temperature, specific conductance, pH, ORP, DO) at a frequency of five minute intervals or greater. The pump's flow rate must be able to "turn over" at least one flow-through-cell volume between measurements (for a 250 mL flow-through-cell with a flow rate of 50 mLs/min., the monitoring frequency would be every five minutes; for a 500 mL flow-through-cell it would be every ten minutes). If the cell volume cannot be replaced in the five minute interval, then the time between measurements must be increased accordingly. Note: during the early phase of purging emphasis should be put on minimizing and stabilizing pumping stress, and recording those adjustments followed by stabilization of indicator parameters. Purging is considered complete and sampling may begin when all the above indicator field parameters have stabilized. Stabilization is considered to be achieved when three consecutive readings are within the following limits:

Turbidity (10% for values greater than 5 NTU; if three Turbidity values are less than 5 NTU, consider the values as stabilized),

**Dissolved Oxygen** (10% for values greater than 0.5 mg/L, if three Dissolved Oxygen values are less than 0.5 mg/L, consider the values as stabilized),

Specific Conductance (3%), Temperature (3%), pH (± 0.1 unit), Oxidation/Reduction Potential (±10 millivolts).

All measurements, except turbidity, must be obtained using a flow-through-cell. Samples for turbidity measurements are obtained before water enters the flow-through-cell. Transparent flow-through-cells are preferred, because they allow field personnel to watch for particulate build-up within the cell. This build-up may affect indicator field parameter values measured within the cell. If the cell needs to be cleaned during purging operations, continue pumping and disconnect cell for cleaning, then reconnect after cleaning and continue monitoring activities. Record start and stop times and give a brief description of cleaning activities.

The flow-through-cell must be designed in a way that prevents gas bubble entrapment in the cell. Placing the flow-through-cell at a 45 degree angle with the port facing upward can help remove bubbles from the flow-through-cell (see Appendix B Low-Flow Setup Diagram). All during the measurement process, the flow-through-cell must remain free of any gas bubbles. Otherwise, the monitoring probes may act erratically. When the pump is turned off or cycling on/off (when using a bladder pump), water in the cell must not drain out. Monitoring probes must remain submerged in water at all times.

#### F. Collect Water Samples

When samples are collected for laboratory analyses, the pump's tubing is disconnected from the "T" connector with a valve and the flow-through-cell. The samples are collected directly from the pump's tubing. Samples must not be collected from the flow-through-cell or from the "T" connector with a valve.

VOC samples are normally collected first and directly into pre-preserved sample containers. However, this may not be the case for all sampling locations; the SAP/QAPP should list the order in which the samples are to be collected based on the project's objective(s). Fill all sample containers by allowing the pump discharge to flow gently down the inside of the container with minimal turbulence.

If the pump's flow rate is too high to collect the VOC/dissolved gases samples, collect the other samples first. Lower the pump's flow rate to a reasonable rate and collect the VOC/dissolved gases samples and record the new flow rate.

During purging and sampling, the centrifugal/peristaltic pump tubing must remain filled with water to avoid aeration of the groundwater. It is recommended that 1/4 inch or 3/8 inch (inside diameter) tubing be used to help insure that the sample tubing remains water filled. If the pump tubing is not completely filled to the sampling point, use the following procedure to collect samples: collect non-VOC/dissolved gases samples first, then increase flow rate slightly until the water completely fills the tubing, collect the VOC/dissolved gases samples, and record new drawdown depth and flow rate.

For bladder pumps that will be used to collect VOC or dissolved gas samples, it is recommended that the pump be set to deliver long pulses of water so that one pulse will fill a 40 mL VOC vial.

Use pre-preserved sample containers or add preservative, as required by analytical methods, to the samples immediately after they are collected. Check the analytical methods (e.g. EPA SW-846, 40 CFR 136, water supply, etc.) for additional information on preservation.

EQASOP-GW 001 Region 1 Low-Stress (Low-Flow) SOP Revision Number: 3 Date: July 30, 1996

Revised: January 19, 2010

Page 19 of 30

If determination of filtered metal concentrations is a sampling objective, collect filtered water samples using the same low flow procedures. The use of an in-line filter (transparent housing preferred) is required, and the filter size (0.45  $\mu$ m is commonly used) should be based on the sampling objective. Pre-rinse the filter with groundwater prior to sample collection. Make sure the filter is free of air bubbles before samples are collected. Preserve the filtered water sample immediately. Note: filtered water samples are not an acceptable substitute for unfiltered samples when the monitoring objective is to obtain chemical concentrations of total mobile contaminants in groundwater for human health or ecological risk calculations.

Label each sample as collected. Samples requiring cooling will be placed into a cooler with ice or refrigerant for delivery to the laboratory. Metal samples after acidification to a pH less than 2 do not need to be cooled.

#### G. Post Sampling Activities

If a recording pressure transducer is used to track drawdown, re-measure water level with tape.

After collection of samples, the pump tubing may be dedicated to the well for re-sampling (by hanging the tubing inside the well), decontaminated, or properly discarded.

Before securing the well, measure and record the well depth (to 0.1 ft.), if not measured the day before purging began. Note: measurement of total well depth annually is usually sufficient after the initial low stress sampling event. However, a greater frequency may be needed if the well has a "silting" problem or if confirmation of well identity is needed.

Secure the well.

#### **DECONTAMINATION**

Decontaminate sampling equipment prior to use in the first well and then following sampling of each well. Pumps should not be removed between purging and sampling operations. The pump, tubing, support cable and electrical wires which were in contact with the well should be decontaminated by one of the procedures listed below.

The use of dedicated pumps and tubing will reduce the amount of time spent on decontamination of the equipment. If dedicated pumps and tubing are used, only the initial sampling event will require decontamination of the pump and tubing.

Page 20 of 30

Note if the previous equipment blank data showed that contaminant(s) were present after using the below procedure or the one described in the SAP/QAPP, a more vigorous procedure may be needed.

#### Procedure 1

Decontaminating solutions can be pumped from either buckets or short PVC casing sections through the pump and tubing. The pump may be disassembled and flushed with the decontaminating solutions. It is recommended that detergent and alcohol be used sparingly in the decontamination process and water flushing steps be extended to ensure that any sediment trapped in the pump is removed. The pump exterior and electrical wires must be rinsed with the decontaminating solutions, as well. The procedure is as follows:

Flush the equipment/pump with potable water.

Flush with non-phosphate detergent solution. If the solution is recycled, the solution must be changed periodically.

Flush with potable or distilled/deionized water to remove all of the detergent solution. If the water is recycled, the water must be changed periodically.

Optional - flush with isopropyl alcohol (pesticide grade; must be free of ketones {e.g., acetone}) or with methanol. This step may be required if the well is highly contaminated or if the equipment blank data from the previous sampling event show that the level of contaminants is significant.

Flush with distilled/deionized water. This step must remove all traces of alcohol (if used) from the equipment. The final water rinse must not be recycled.

#### Procedure 2

Steam clean the outside of the submersible pump.

Pump hot potable water from the steam cleaner through the inside of the pump. This can be accomplished by placing the pump inside a three or four inch diameter PVC pipe with end cap. Hot water from the steam cleaner jet will be directed inside the PVC pipe and the pump exterior will be cleaned. The hot water from the steam cleaner will then be pumped from the PVC pipe through the pump and collected into another container. Note: additives or solutions should not be added to the steam cleaner.

Pump non-phosphate detergent solution through the inside of the pump. If the solution is recycled, the solution must be changed periodically.

Page 21 of 30

Pump potable water through the inside of the pump to remove all of the detergent solution. If the solution is recycled, the solution must be changed periodically.

Pump distilled/deionized water through the pump. The final water rinse must not be recycled.

#### FIELD QUALITY CONTROL

Quality control samples are required to verify that the sample collection and handling process has not compromised the quality of the groundwater samples. All field quality control samples must be prepared the same as regular investigation samples with regard to sample volume, containers, and preservation. Quality control samples include field duplicates, equipment blanks, matrix spike/matrix spike duplicates, trip blanks (VOCs), and temperature blanks.

#### FIELD LOGBOOK

A field log shall be kept to document all groundwater field monitoring activities (see Appendix C, example table), and record the following for each well:

Site name, municipality, state.

Well identifier, latitude-longitude or state grid coordinates.

Measuring point description (e.g., north side of PVC pipe).

Well depth, and measurement technique.

Well screen length.

Pump depth.

Static water level depth, date, time and measurement technique.

Presence and thickness of immiscible liquid (NAPL) layers and detection method.

Pumping rate, drawdown, indicator parameters values, calculated or measured total volume pumped, and clock time of each set of measurements.

Type of tubing used and its length.

Page 22 of 30

Type of pump used.

Clock time of start and end of purging and sampling activity.

Types of sample bottles used and sample identification numbers.

Preservatives used.

Parameters requested for analyses.

Field observations during sampling event.

Name of sample collector(s).

Weather conditions, including approximate ambient air temperature.

QA/QC data for field instruments.

Any problems encountered should be highlighted.

Description of all sampling/monitoring equipment used, including trade names, model number, instrument identification number, diameters, material composition, etc.

#### DATA REPORT

Data reports are to include laboratory analytical results, QA/QC information, field indicator parameters measured during purging, field instrument calibration information, and whatever other field logbook information is needed to allow for a full evaluation of data usability.

Note: the use of trade, product, or firm names in this sampling procedure is for descriptive purposes only and does not constitute endorsement by the U.S. EPA.

### APPENDIX A PERISTALTIC PUMPS

Before selecting a peristaltic pump to collect groundwater samples for VOCs and/or dissolved gases (e.g., methane, carbon dioxide, etc.) consideration should be given to the following:

• The decision of whether or not to use a peristaltic pump is dependent on the intended use of the data.

 If the additional sampling error that may be introduced by this device is NOT of concern for the VOC/dissolved gases data's intended use, then this device may be

acceptable.

• If minor differences in the groundwater concentrations could effect the decision, such as to continue or terminate groundwater cleanup or whether the cleanup goals have been reached, then this device should NOT be used for VOC/dissolved gases sampling. In these cases, centrifugal or bladder pumps are a better choice for more accurate results.

EPA and USGS have documented their concerns with the use of the peristaltic pumps to collect water sample in the below documents.

• "Suction Pumps are not recommended because they may cause degassing, pH modification, and loss of volatile compounds" *A Compendium of Superfund Field Operations Methods*, EPA/540/P-87/001, December 1987.

• "The agency does not recommend the use of peristaltic pumps to sample ground water particularly for volatile organic analytes" *RCRA Ground-Water Monitoring Draft Technical Guidance*, EPA Office of Solid Waste, November 1992.

• "The peristaltic pump is limited to shallow applications and can cause degassing resulting in alteration of pH, alkalinity, and volatiles loss", *Low-flow (Minimal drawdown) Ground-Water Sampling Procedures*, by Robert Puls & Michael Barcelona, April 1996, EPA/540/S-95/504.

• "Suction-lift pumps, such as peristaltic pumps, can operate at a very low pumping rate; however, using negative pressure to lift the sample can result in the loss of volatile analytes", USGS Book 9 Techniques of Water-Resources Investigation, Chapter A4. (Version 2.0, 9/2006).

#### APPENDIX B

#### SUMMARY OF SAMPLING INSTRUCTIONS

These instructions are for using an adjustable rate, submersible pump or a peristaltic pump with the pump's intake placed at the midpoint of a 10 foot or less well screen or an open interval. The water level in the monitoring well is above the top of the well screen or open interval, the ambient temperature is above 32°F, and the equipment is not dedicated. Field instruments are already calibrated. The equipment is setup according to the diagram at the end of these instructions.

- 1. Review well installation information. Record well depth, length of screen or open interval, and depth to top of the well screen. Determine the pump's intake depth (e.g., mid-point of screen/open interval).
- 2. On the day of sampling, check security of the well casing, perform any safety checks needed for the site, lay out a sheet of polyethylene around the well (if necessary), and setup the equipment. If necessary a canopy or an equivalent item can be setup to shade the pump's tubing and flow-through-cell from the sun light to prevent the sun light from heating the groundwater.
- 3. Check well casing for a reference mark. If missing, make a reference mark. Measure the water level (initial) to 0.01 ft. and record this information.
- 4. Install the pump's intake to the appropriate depth (e.g., midpoint) of the well screen or open interval. Do not turn-on the pump at this time.
- 5. Measure water level and record this information.
- 6. Turn-on the pump and discharge the groundwater into a graduated waste bucket. Slowly increase the flow rate until the water level starts to drop. Reduce the flow rate slightly so the water level stabilizes. Record the pump's settings. Calculate the flow rate using a graduated container and a stop watch. Record the flow rate. Do not let the water level drop below the top of the well screen.

If the groundwater is highly turbid or colored, continue to discharge the water into the bucket until the water clears (visual observation); this usually takes a few minutes. The turbid or colored water is usually from the well being disturbed during the pump installation. If the water does not clear, then you need to make a choice whether to continue purging the well (hoping that it will clear after a reasonable time) or continue to

the next step. Note, it is sometimes helpful to install the pump the day before the sampling event so that the disturbed materials in the well can settle out.

If the water level drops to the top of the well screen during the purging of the well, stop purging the well, and do the following:

Wait for the well to recharge to a sufficient volume so samples can be collected. This may take awhile (pump maybe removed from well, if turbidity is not a problem). The project manager will need to make the decision when samples should be collected and the reasons recorded in the site's log book. A water level measurement needs to be performed and recorded before samples are collected. When samples are being collected, the water level must not drop below the top of the screen or open interval. Collect the samples from the pump's tubing. Always collect the VOCs and dissolved gases samples first. Normally, the samples requiring a small volume are collected before the large volume samples are collected just in case there is not sufficient water in the well to fill all the sample containers. All samples must be collected, preserved, and stored according to the analytical method. Remove the pump from the well and decontaminate the sampling equipment.

If the water level has dropped 0.3 feet or less from the initial water level (water level measure before the pump was installed); proceed to Step 7. If the water level has dropped more than 0.3 feet, calculate the volume of water between the initial water level and the stabilized water level. Add the volume of the water which occupies the pump's tubing to this calculation. This combined volume of water needs to be purged from the well after the water level has stabilized before samples are be collected.

7. Attach the pump's tubing to the "T" connector with a valve (or a three-way stop cock). The pump's tubing from the well casing to the "T" connector must be as short as possible to prevent the groundwater in the tubing from heating up from the sun light or from the ambient air. Attach a short piece of tubing to the other end of the end of the "T" connector to serve as a sampling port for the turbidity samples. Attach the remaining end of the "T" connector to a short piece of tubing and connect the tubing to the flow-through-cell bottom port. To the top port, attach a small piece of tubing to direct the water into a calibrated waste bucket. Fill the cell with the groundwater and remove all gas bubbles from the cell. Position the flow-through-cell in such a way that if gas bubbles enter the cell they can easily exit the cell. If the ports are on the same side of the cell and the cell is cylindrical shape, the cell can be placed at a 45-degree angle with the ports facing upwards; this position should keep any gas bubbles entering the cell away from the monitoring probes and allow the gas bubbles to exit the cell easily (see Low-Flow Setup Diagram). Note,

make sure there are no gas bubbles caught in the probes' protective guard; you may need to shake the cell to remove these bubbles.

- 8. Turn-on the monitoring probes and turbidity meter.
- 9. Record the temperature, pH, dissolved oxygen, specific conductance, and oxidation/reduction potential measurements. Open the valve on the "T" connector to collect a sample for the turbidity measurement, close the valve, do the measurement, and record this measurement. Calculate the pump's flow rate from the water exiting the flow-through-cell using a graduated container and a stop watch, and record the measurement. Measure and record the water level. Check flow-through-cell for gas bubbles and sediment; if present, remove them.
- 10. Repeat Step 9 every 5 minutes or as appropriate until monitoring parameters stabilized. Note at least one flow-through-cell volume must be exchanged between readings. If not, the time interval between readings will need to be increased. Stabilization is achieved when three consecutive measurements are within the following limits:

**Turbidity** (10% for values greater than 5 NTUs; if three Turbidity values are less than 5 NTUs, consider the values as stabilized),

**Dissolved Oxygen** (10% for values greater than 0.5 mg/L, if three Dissolved Oxygen values are less than 0.5 mg/L, consider the values as stabilized),

Specific Conductance (3%), Temperature (3%), pH (± 0.1 unit), Oxidation/Reduction Potential (±10 millivolts).

If these stabilization requirements do not stabilize in a reasonable time, the probes may have been coated from the materials in the groundwater, from a buildup of sediment in the flow-through-cell, or a gas bubble is lodged in the probe. The cell and the probes will need to be cleaned. Turn-off the probes (not the pump), disconnect the cell from the "T" connector and continue to purge the well. Disassemble the cell, remove the sediment, and clean the probes according to the manufacturer's instructions. Reassemble the cell and connect the cell to the "T" connector. Remove all gas bubbles from the cell, turn-on the probes, and continue the measurements. Record that the time the cell was cleaned.

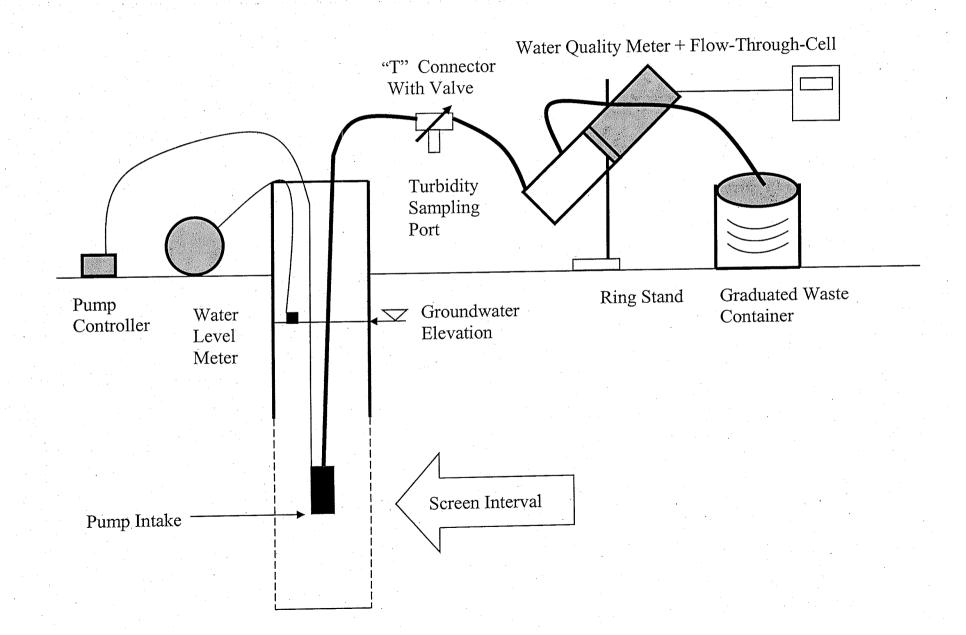

11. When it is time to collect the groundwater samples, turn-off the monitoring probes, and disconnect the pump's tubing from the "T" connector. If you are using a centrifugal or peristaltic pump check the pump's tubing to determine if the tubing is completely filled with water (no air space).

All samples must be collected and preserved according to the analytical method. VOCs and dissolved gases samples are normally collected first and directly into pre-preserved sample containers. However, this may not be the case for all sampling locations; the SAP/QAPP should list the order in which the samples are to be collected based on the project's objective(s). Fill all sample containers by allowing the pump discharge to flow gently down the inside of the container with minimal turbulence.

If the pump's tubing is not completely filled with water and the samples are being collected for VOCs and/or dissolved gases analyses using a centrifugal or peristaltic pump, do the following:

All samples must be collected and preserved according to the analytical method. The VOCs and the dissolved gases (e.g., methane, ethane, ethene, and carbon dioxide) samples are collected last. When it becomes time to collect these samples increase the pump's flow rate until the tubing is completely filled. Collect the samples and record the new flow rate.

- 12. Store the samples according to the analytical method.
- 13. Record the total purged volume (graduated waste bucket). Remove the pump from the well and decontaminate the sampling equipment.

Subject:

Tier II Inorganic Data Validation, SDG CTOWE20\_005

Empirical Laboratories, LLC

CTO WE20, Study Area Screening Evaluation, On-Shore Derecktor Shipyard, Site 19,

NAVSTA Newport, Newport, Rhode Island

Total and Dissolved Metals:

3/Groundwaters/

DSY-GW-DUP02-031611

DSY-GW-MW204-031711

DSY-GW-MW219-031611

(Field Duplicate Pair: DSY-GW-MW219-031611/DSY-GW-DUP02-031611)

1/Rinsate Blank/

DSY-GW-RB01-031611

Tetra Tech NUS, Inc. (TtNUS) performed a Tier II data validation on the target analyte list (TAL) metals analytical data for the samples in this SDG. The samples were collected as part of a Study Area Screening Evaluation at On-Shore Derecktor Shipyard, Site 19 at NAVSTA Newport, Newport, Rhode Island on March 16 and 17, 2011. Sample collection and analysis were performed according to the Work Plan Addendum 1 for Study Area Screening Evaluation, On-Shore Derecktor Shipyard, Site 19, NAVSTA Newport, Newport, Rhode Island; dated February 2011.

The total and dissolved metal analyses were performed according to USEPA SW-846 Methods 6010C/7470A. The project specific criteria listed in the site Work Plan Addendum 1 were applied for validation of the data, including project action limits (PALs) listed in Table A-1. The data user should consider the most recent revisions to the applicable regulatory limits. The data validation was performed in accordance with the <a href="Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses">Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses</a>, Part IV, November 2008.

The sample results, validation qualifiers (VQL), and qualifier codes (QLCD) are presented in the enclosed data summary tables. A list of the qualifier codes, which provide the reasons for the validation qualifiers, is enclosed.

The data were evaluated based on the following parameters:

- Laboratory Data Completeness
- Holding Times
  - Calibration Verification
- Laboratory Blank Analyses
- ICP Interference Check Sample Results
- Matrix Spike Results
- Laboratory Duplicate Results
- Laboratory Control Sample Results

Memo to T. Campbell May 03, 2011 Page 2

Field Duplicate Precision

NA

- ICP Serial Dilution Results
- Limits of Detection
- \* All quality control criteria were met for this parameter. NA Not applicable for this SDG.

#### **Laboratory Data Completeness**

The laboratory mistakenly logged in sample DSY-GW-MW204-031711 with the suffix "-031611" and the sample date 3/16/11 (actual sample date is 3/17/11). On April 25, 2011 the laboratory resubmitted all affected forms to correct the sample ID and sample date.

#### **Calibration Verification**

The following table summarizes the analytes that recovered below the 90% recovery QC limit in the continuing calibration verification:

Analyta	%R	Actio	n	Affected Comples
Analyte	7o⊓	(+)	NDs	Affected Samples
Arsenic	88.8	J	UJ	
Calcium	Calcium 89.2 J	J	UJ	
Iron	88.7	J	UJ	All total and dissolved metals samples
Magnesium	86.8, 86.2	J	UJ	

The recovery of arsenic was below the QC limit in the continuing calibration verification; therefore, the project accuracy goals may be impacted. The positive and non-detected arsenic results in all samples are usable as estimated values which may be biased low.

Although the recoveries of calcium, iron, and magnesium were below the QC limit in the continuing calibration verification, the project accuracy goals are not impacted since there are no project action limits established for these metals for the groundwater samples. The positive and non-detected calcium, iron, and magnesium results in all samples are usable as estimated values which may be biased low.

#### **Limits of Detection**

The laboratory reported non-detected metals results at the limit of detection (LOD). The positive results below the laboratory's limit of quantitation (LOQ) and above the detection limit (DL) are estimated (J) due to uncertainty below the LOQ. Project action limits (PALs) were evaluated for non-detected results (reported at the LOD) only.

In select samples, the nickel, silver, and/or chromium reporting limits were raised due to matrix interferences.

All PALs for the groundwater samples were met by the LODs except for thallium in select samples due to dilution. Data usability may be impacted for thallium.

Memo to T. Campbell May 03, 2011 Page 3

#### **Analytical Data Usability Assessment**

The data usability assessment was performed to determine if the analytical data reported by the laboratory for this SDG met the project data quality objectives for acceptable accuracy, precision, sensitivity, and completeness; and to determine and define the impact of the exceeded quality control indicators on the technical usability of the data. Please refer to the specific sections in the above validation report for further details.

This is a partial evaluation based on laboratory quality control (QC) and limited field information available at the time of the assessment. A comprehensive project data usability assessment will be performed later when all data are available.

The project goals with respect to accuracy were met for the metals data set with the following exception. Arsenic was qualified as estimated in all samples due to a low continuing calibration verification recovery; the affected results may be biased low. Although specific method criteria were not met in this instance, the affected positive and non-detected results are usable as estimated values which may have a minor impact on data usability. In addition, calcium, iron, and magnesium were qualified as estimated in all samples due to low continuing calibration verification recoveries. Although specific method criteria were not met in this instance, data usability is not impacted and the affected positive and non-detected results are usable as estimated values.

The project goals with respect to sensitivity were met for the metals data set with the following exception. All PALs for the groundwater samples were met by the LODs except for thallium in select samples due to dilution. Data usability may be impacted for thallium.

The project goals with respect to precision and laboratory data completeness were met for the metals data set. Data usability is not impacted with regards to precision and laboratory data completeness.

Tables:

Data Validation Qualifiers and Codes

Data Summary Tables

**Enclosures:** 

**Data Validation Worksheets** 

#### **Data Validation Qualifiers and Codes**

#### **Data Validation Qualifiers:**

= No qualifier attached to value (positive hit)

J = Value is estimated

U = Value is not detected

UJ = Value is not detected and estimated

R = Value (positive hit) is not usable

UR = Value was reported as ND but is not usable

#### **Qualifier Codes:**

A = Lab Blank Contamination

B = Field Blank Contamination

C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)

C01 = GC/MS Tuning Noncompliance

D = MS/MSD Recovery Noncompliance

E = LCS/LCSD Recovery Noncompliance

F = Lab Duplicate Imprecision

G = Field Duplicate Imprecision

H = Holding Time Exceedance

I = ICP Serial Dilution Noncompliance

J = GFAA PDS - GFAA MSA's r < 0.995

K = ICP Interference - includes ICS % R Noncompliance

L = Instrument Calibration Range Exceedance

M = Sample Preservation Noncompliance

N = Internal Standard Noncompliance

N01 = Internal Standard Recovery Noncompliance Dioxins

N02 = Recovery Standard Noncompliance Dioxins

N03 = Clean-up Standard Noncompliance Dioxins

O = Poor Instrument Performance (e.g. base-line drifting)

P = Uncertainty below quantitation limit (< QL but ≥ MDL)

Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)

R = Surrogates Recovery Noncompliance

S = Pesticide/PCB Resolution

T = % Breakdown Noncompliance for DDT and Endrin

U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC

V = Non-linear calibrations; correlation coefficient r < 0.995

W = EMPC result

X = Signal to noise response drop

Y = Percent solids <30%

Z = Uncertainty at 2 sigma deviation is greater than sample activity

(Field Duplicate Pair: DSY-SB204-SO-0002/DSY-SO-DUP01-021411)

Tetra Tech NUS, Inc. (TtNUS) performed a Tier II data validation on the target analyte list (TAL) metals analytical data for the samples in this SDG. The samples were collected as part of a Study Area Screening Evaluation at On-Shore Derecktor Shipyard, Site 19 at NAVSTA Newport, Newport, Rhode Island from February 9-15, 2011. Sample collection and analysis were performed according to the Work Plan Addendum 1 for Study Area Screening Evaluation, On-Shore Derecktor Shipyard, Site 19, NAVSTA Newport, Newport, Rhode Island; dated February 2011.

The metal analyses were performed according to USEPA SW-846 Methods 6010C/7471A. The project specific criteria listed in the site Work Plan Addendum 1 were applied for validation of the data, including project action limits (PALs) listed in Table A-2. The data user should consider the most recent revisions to the applicable regulatory limits. The data validation was performed in accordance with the Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses, Part IV, November 2008.

The sample results, validation qualifiers (VQL), and qualifier codes (QLCD) are presented in the enclosed data summary tables. A list of the qualifier codes, which provide the reasons for the validation qualifiers, is enclosed.

The data were evaluated based on the following parameters:

- Laboratory Data Completeness
- Holding Times
  - Calibration Verification
  - Laboratory Blank Analyses
  - ICP Interference Check Sample Results
  - Matrix Spike Results

Memo to T. Campbell April 05, 2011 Page 2

- Laboratory Duplicate Results
- Laboratory Control Sample Results
  - Field Duplicate Precision
    - ICP Serial Dilution Results
- Percent Solids
- Limits of Detection

#### **Calibration Verification**

The following table summarizes the analytes that recovered below the 90% recovery QC limit in the continuing calibration verification:

Analyte	%R	Action		Affected Comples	
		(+)	NDs	Affected Samples	
Lead	88.4	J			
Selenium	87.1	J	UJ	All samples except DSY-SB202-SO-0204	
Zinc	87.5	J			

The recovery of lead was below the QC limit in the continuing calibration verification; therefore, the project accuracy goals may be impacted. The positive lead results in the affected samples are usable as estimated values which may be biased low.

Although the recovery of selenium and zinc was below the QC limit in the continuing calibration verification, the project accuracy goals are not impacted since the affected results are more than an order of magnitude below the PAL. The positive and non-detected selenium and zinc results in the affected samples are usable as estimated values which may be biased low.

#### **Laboratory Blank Analyses**

The following table summarizes the level of blank contamination detected in the laboratory blanks:

Analyte	Maximum Conc. (mg/kg)	Action Level (mg/kg)*	Affected Sample
Cadmium	0.0597	0.2985	DSY-SB205-SO-0002

<sup>\*</sup>The action level is based on the assumption of 2 g of sample, 100 percent solids, and a dilution factor of 1. The action level is adjusted based on sample-specific preparation factors.

The positive cadmium result below the blank action level and below the limit of detection (LOD) is changed to a non-detected value (U) at the LOD due to laboratory blank contamination.

Although cadmium contamination was found in the laboratory blanks, the project sensitivity goals are not impacted since the affected cadmium result is below the project action limit for. The affected cadmium result in sample DSY-SB205-SO-0002 is usable as a non-detected value.

#### **ICP Interference Check Sample Results**

The following results were qualified in the affected samples due to ICP interference attributed to the high concentration of iron in the samples:

<sup>\*</sup> All quality control criteria were met for this parameter.

Analyte	Act (+)	tion ND	Bias	Affected Samples
Lead	J		High	DSY-SB201-SO-0204, DSY-SB202-SO-0204, DSY-SB204-SO-0002, DSY-SB204-SO-0810, DSY-SB206-SO-0810, DSY-SB207-SO-1012, DSY-SO-DUP01-021411

The positive lead results in the affected samples are qualified as estimated (J) due to positive ICP interference attributed to iron. These results may be biased high.

There were positive ICP interferences attributed to the high concentration of iron that resulted in estimating the positive lead results in the samples listed above; therefore, the project accuracy goals may be impacted. The positive lead results in the affected samples are usable as estimated values which may be biased high.

#### **Matrix Spike Results**

The following table summarizes the analyte that recovered outside of the 80-120% recovery QC limits in the matrix spike (MS) analysis of sample DSY-SB202-SO-0204:

Analyte	MC 9/ Paggyany	Action	
Analyte	MS %Recovery	(+)	NDs
Antimony	35.1		UJ
Copper	69.2	J	
Potassium	78.7	J	
Zinc	68.5	J	

The positive and non-detected antimony, copper, potassium, and zinc results are estimated (J, UJ) in all samples due to low MS recoveries.

Although the MS percent recovery criteria were not met for antimony, copper, potassium, and zinc; the project accuracy goals are not impacted since there are no project action limits established for potassium for the soil samples and the affected antimony, copper, and zinc sample results are more than an order of magnitude below the PALs. The positive and non-detected antimony, copper, potassium, and zinc results in all samples are usable as estimated values which may be biased low.

#### **ICP Serial Dilution Results**

The following table summarizes the results in the ICP serial dilution analysis of sample DSY-SB202-SO-0204 for which the percent difference between the initial and diluted results was above the 10% QC criterion when the initial sample result was above 50 times the method detection limit (MDL):

Analyta	% Difference	Bias	Action		
Analyte	% Dillerence		(+)	NDs	
Manganese	12.5	Low	J		

The positive manganese results are estimated (J) in all samples. Since the initial sample result was lower than the diluted result, the affected sample results may be biased low.

Memo to T. Campbell April 05, 2011 Page 4

A sample matrix suppressing effect for manganese was detected in the ICP serial dilution analysis; therefore, the project accuracy goals may be impacted. The positive manganese results in all samples are usable as estimated values which may be biased low.

#### **Limits of Detection**

The laboratory reported non-detected metals results down to the limit of detection (LOD). The positive results below the laboratory's limit of quantitation (LOQ) and above the detection limit (DL) are estimated (J) due to uncertainty below the LOQ.

Project action limits (PALs) were evaluated for non-detected results (reported at the LOD) only.

All PALs for the soil samples were met by the LODs.

For select samples, the detection limits for silver and/or thallium were raised due to interferences. Data usability is not impacted for silver and thallium since the LODs are less than the PALs.

Cadmium in sample DSY-SB205-SO-0002 was changed to a non-detected value due to blank contamination. As discussed above in the Laboratory Blank Analyses section, data usability is not impacted.

#### **Analytical Data Usability Assessment**

The data usability assessment was performed to determine if the analytical data reported by the laboratory for this SDG met the project data quality objectives for acceptable accuracy, precision, sensitivity, and completeness; and to determine and define the impact of the exceeded quality control indicators on the technical usability of the data. Please refer to the specific sections in the above validation report for further details.

This is a partial evaluation based on laboratory quality control (QC) and limited field information available at the time of the assessment. A comprehensive project data usability assessment will be performed later when all data are available.

The project goals with respect to accuracy were met for the metals data set with the following exceptions. Lead was qualified as estimated in select samples due to a low continuing calibration verification recovery; however, lead was also qualified as estimated in select samples due to positive ICP interference; consequently, the bias for the lead results is indeterminate. Manganese was qualified as estimated in all samples due to a matrix suppressing effect detected in the ICP serial dilution; the affected results may be biased low. Although specific method criteria were not met in these instances, the affected positive results are usable as estimated values which may have a minor impact on data usability. Selenium and zinc were qualified as estimated in select samples due to low continuing calibration verification recoveries. Antimony, copper, potassium, and zinc were qualified as estimated in all samples due to low MS recoveries. Although specific method criteria were not met in these instances, data usability is not impacted and the affected positive and non-detected results are usable as estimated values.

The project goals with respect to precision, sensitivity, and laboratory data completeness were met for the metals data set. Data usability is not impacted with regards to precision, sensitivity, and laboratory data completeness. Memo to T. Campbell April 05, 2011 Page 5

Tables:

Data Validation Qualifiers and Codes

**Data Summary Tables** 

Enclosures:

Data Validation Worksheets

### Data Validation Qualifiers and Codes

#### **Data Validation Qualifiers:**

= No qualifier attached to value (positive hit)

J = Value is estimated

U = Value is not detected

UJ = Value is not detected and estimated

R = Value (positive hit) is not usable

UR = Value was reported as ND but is not usable

#### **Qualifier Codes:**

A = Lab Blank Contamination

B = Field Blank Contamination

C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)

C01 = GC/MS Tuning Noncompliance

D = MS/MSD Recovery Noncompliance

E = LCS/LCSD Recovery Noncompliance

F = Lab Duplicate Imprecision

G = Field Duplicate Imprecision

H = Holding Time Exceedance

I = ICP Serial Dilution Noncompliance

J = GFAA PDS - GFAA MSA's r < 0.995

K = ICP Interference - includes ICS % R Noncompliance

L = Instrument Calibration Range Exceedance

M = Sample Preservation Noncompliance

N = Internal Standard Noncompliance

N01 = Internal Standard Recovery Noncompliance Dioxins

N02 = Recovery Standard Noncompliance Dioxins

N03 = Clean-up Standard Noncompliance Dioxins

O = Poor Instrument Performance (e.g. base-line drifting)

P = Uncertainty below quantitation limit (< QL but ≥ MDL)

Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)

R = Surrogates Recovery Noncompliance

S = Pesticide/PCB Resolution

T = % Breakdown Noncompliance for DDT and Endrin

U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC

V = Non-linear calibrations; correlation coefficient r < 0.995

W = EMPC result

X = Signal to noise response drop

Y = Percent solids <30%

Z = Uncertainty at 2 sigma deviation is greater than sample activity

DSY-SG-MW03-0608

DSY-SG-MW12-0506

(Field Duplicate Pair: DSY-SG-MW03-0608/DSY-SG-DUP01-0211)

Tetra Tech NUS, Inc. (TtNUS) performed a Tier II data validation on the volatile organic compound (VOC) analytical data for the air samples collected at the On-Shore Derecktor Shipyard, Site 19 at NAVSTA Newport, Newport, RI site on February 24 and March 3, 2011. Sample collection and analysis were performed according to the Work Plan Addendum 1 for Study Area Screening Evaluation, On-Shore Derecktor Shipyard, Site 19, NAVSTA Newport, Newport, Rhode Island; dated February 2011.

The VOC analysis was performed according to Method TO-15 in both the full scan and selective ion monitoring (SIM) modes. The project specific criteria listed in the site Work Plan Addendum 1 were applied for validation of the data, including project action limits (PALs). The data user should consider the most recent revisions to the applicable regulatory limits. The VOC data validation was performed in accordance with the <a href="Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses">Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses</a>, December 1996.

The sample results, validation qualifiers (VQL), and qualifier codes (QLCD) are presented in the enclosed data summary tables. A list of the qualifier codes, which provide the reasons for the validation qualifiers, is enclosed.

The data were evaluated based on the following parameters:

- Laboratory Data Completeness
- Preservation and Technical Holding Times
- GC/MS Instrument Performance Check (Tuning)
- Initial and Continuing Calibrations
- Blanks
- Surrogate Compounds
  - Internal Standards
- Laboratory Duplicates
- Laboratory Control Sample/Laboratory Control Sample Duplicate
  - Field Duplicates

Memo to T. Campbell May 05, 2011 Page 2

- Limits of Detection
  - \* All criteria were met for this parameter.

# **Laboratory Data Completeness**

On April 11, 2011 the laboratory submitted the instrument method detection limits (MDLs) in units of  $\mu g/m3$  since the sample results are reported down to the MDLs. The laboratory does not currently have a way to populate the report with MDLs in units of  $\mu g/m3$ .

On April 21, 2011 the laboratory resubmitted all affected forms to report the non-detected values at the LOD, except the non-standard compounds acrylonitrile and vinyl bromide. The LODs for non-standard compounds are listed as "NA" in the Forms I. Tetra Tech Chemist J. Cardinal used professional judgment to report non-detects for acrylonitrile and vinyl bromide at the reporting limit (LOQ) in the summary data tables.

#### **Field Duplicates**

The field duplicate pair DSY-SG-MW03-0608/DSY-SG-DUP01-0211 did not meet the field duplicate QC criteria of RPD <30% for the following compounds:

Analyte	Sample Result	Duplicate Result	RPD	Action		
Analyte	(μg/m3)	(μg/m3)	NFD	(+)	NDs	
Vinyl chloride	0.39	0.15	89	J		
Ethylbenzene	0.25	0.13	63	J		
m+p-Xylenes	0.73	0.15 J	132	J		
o-Xylene	0.58	0.064 J	160	J		
4-Ethyltoluene	1.5	0.68 U	NC	J	UJ	
1,2,4-Trimethylbenzene	2.4	0.68 U	NC	J	UJ	

J – Result is estimated.

In addition, the 4-ethyltoluene and 1,2,4-trimethylbenzene sample results are greater than 2x the reporting limit while the duplicate results are non-detect.

Although vinyl chloride, ethylbenzene, m+p-xylenes, o-xylene, 4-ethyltoluene, and 1,2,4-trimethylbenzene did not meet the field duplicate QC criteria, the project precision goals are not impacted since either there are no project action limits established for these compounds for the air samples or the affected sample results are much lower than the project action limits. The positive and non-detected vinyl chloride, ethylbenzene, m+p-xylenes, o-xylene, 4-ethyltoluene, and 1,2,4-trimethylbenzene results in samples DSY-SG-MW03-0608 and DSY-SG-DUP01-0211 are usable as estimated values for which the bias is indeterminate.

### **Limits of Detection**

Non-detected results were reported at the laboratory's limit of detection (LOD) except for the non-standard compounds acrylonitrile and vinyl bromide for which the non-detected results were reported at the laboratory's limit of quantitation (LOQ, or RL). Positive results below LOQ and above the

U - Result is not detected.

NC - Not calculated.

Memo to T. Campbell May 05, 2011 Page 3

laboratory's method detection limit (MDL) were qualified as estimated (J) due to uncertainty below the LOQ. Project action limits (PALs) are evaluated for non-detected values only (reported at the MDL).

All PALs were met by the MDLs except for 1,2-dibromoethane, acrylonitrile, and hexachlorobutadiene. Data usability may be impacted for these compounds.

# Analytical Data Usability Assessment

The data usability assessment was performed to determine if the analytical data reported by the laboratory for this SDG met the project data quality objectives for acceptable accuracy, precision, sensitivity, and completeness; and to determine and define the impact of the exceeded quality control indicators on the technical usability of the data. Please refer to the specific sections in the above validation report for further details.

This is a partial evaluation based on laboratory quality control (QC) and limited field information available at the time of the assessment. A comprehensive project data usability assessment will be performed later when all data are available.

The project goals with respect to accuracy were met for the volatiles data set. Data usability is not impacted with regards to accuracy.

The project goals with respect to precision were met for the volatiles data set. Vinyl chloride, ethylbenzene, m+p-xylenes, o-xylene, 4-ethyltoluene, and 1,2,4-trimethylbenzene were qualified as estimated in samples DSY-SG-MW03-0608 and DSY-SG-DUP01-0211 due to poor field duplicate precision. Although the QC criteria were not met in this instance, data usability is not impacted and the affected positive and non-detected results are usable as estimated values.

The project goals with respect to sensitivity were met for the volatiles data set with the following exception. All PALs were met by the MDLs except for 1,2-dibromoethane, acrylonitrile, and hexachlorobutadiene. Data usability may be impacted for these compounds.

The project goals with respect to laboratory data completeness were met for the volatiles data set. Data usability is not impacted with regards to laboratory data completeness.

Tables:

Data Summary Tables

Data Validation Qualifiers and Codes

Enclosures:

**Data Validation Worksheets** 

# Data Validation Qualifiers and Codes

# **Data Validation Qualifiers:**

= No qualifier attached to value (positive hit)

J = Value is estimated

U = Value is not detected

UJ = Value is not detected and estimated

R = Value (positive hit) is not usable

UR = Value was reported as ND but is not usable

#### **Qualifier Codes:**

A = Lab Blank Contamination

B = Field Blank Contamination

C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)

C01 = GC/MS Tuning Noncompliance

D = MS/MSD Recovery Noncompliance

E = LCS/LCSD Recovery Noncompliance

F = Lab Duplicate Imprecision

G = Field Duplicate Imprecision

H = Holding Time Exceedance

1 = ICP Serial Dilution Noncompliance

J = GFAA PDS - GFAA MSA's r < 0.995

K = ICP Interference - includes ICS % R Noncompliance

L = Instrument Calibration Range Exceedance

M = Sample Preservation Noncompliance

N = Internal Standard Noncompliance

N01 = Internal Standard Recovery Noncompliance Dioxins

N02 = Recovery Standard Noncompliance Dioxins

N03 = Clean-up Standard Noncompliance Dioxins

O = Poor Instrument Performance (e.g. base-line drifting)

P = Uncertainty below quantitation limit (< QL but ≥ MDL)

Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)

R = Surrogates Recovery Noncompliance

S = Pesticide/PCB Resolution

T = % Breakdown Noncompliance for DDT and Endrin

U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC

V = Non-linear calibrations; correlation coefficient r < 0.995

W = EMPC result

X = Signal to noise response drop

Y = Percent solids <30%

Z = Uncertainty at 2 sigma deviation is greater than sample activity

Tetra Tech NUS, Inc. (TtNUS) performed a Tier II data validation on the volatile organic compounds (VOC), polycyclic aromatic hydrocarbons (PAH), polychlorinated biphenyls (PCB), diesel range organic (DRO; C8-C40), and gasoline range organic (GRO; C6-C10) analytical data for the samples in this SDG. The samples were collected at the On-Shore Derecktor Shipyard, Site 19 at NAVSTA Newport, Newport, RI from February 22 - 25, 2011. Sample collection and analysis were performed according to the Work Plan Addendum 1 for Study Area Screening Evaluation, On-Shore Derecktor Shipyard, Site 19, NAVSTA Newport, Newport, Rhode Island; dated February 2011.

The VOC analysis was performed according to USEPA SW-846 Method 8260B. The PAH analysis was performed according to USEPA SW-846 Method 8270C. The PCB analysis was performed according to USEPA SW-846 Method 8082A. The DRO and GRO analyses were performed according to USEPA SW-846 Method 8015B.

The project specific criteria listed in the site Work Plan Addendum 1 were applied for validation of the data, including project action limits (PALs) listed in Table A-2. The data user should consider the most recent revisions to the applicable regulatory limits. The VOC, PAH, GRO, and DRO data validation was performed in accordance with the <u>Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses</u>, December 1996. The PCB data validation was performed according to the <u>Region I, EPA-NE Laboratory Data Validation Functional Guidelines for Evaluating Organic Analyses</u>, Part III, February 2004.

The sample results, validation qualifiers (VQL), and qualifier codes (QLCD) are presented in the enclosed data summary tables. A list of the qualifier codes, which provide the reasons for the validation qualifiers, is enclosed.

The data were evaluated based on the following parameters:

- Laboratory Data Completeness
- Preservation and Technical Holding Times
- GC/MS Instrument Performance Check (Tuning)
  - Initial and Continuing Calibrations
- Blanks
  - Surrogate Compounds
- Internal Standards
  - Matrix Spike/Matrix Spike Duplicate
- Laboratory Control Sample/Laboratory Control Sample Duplicate
  - Field Duplicates
  - Analyte Identification/Quantitation
- Percent Solids
  - Limits of Detection
    - \* All criteria were met for this parameter.

#### **Laboratory Data Completeness**

#### **Volatiles**

On April 6, 2011 the laboratory resubmitted the preparation bench sheets for the volatile samples to show that the pH of the samples was  $\leq 2$  since this was not provided in the original data package.

#### **PCB**

On April 6, 2011 the laboratory resubmitted the case narrative to note that sample DSY-SO-SB214-0203 surrogates were outside limits on both columns. The laboratory suspected matrix interferences for this sample. On April 6, 2011 the laboratory further clarified in an email that the non-compliance was evaluated the day after the holding time expired. Since the sample was outside holding time and the recovery was not rejectable (>10%), no further action was taken by the laboratory. On April 11, 2011 Tetra Tech Chemist, J. Cardinal, instructed the laboratory that, in the future, samples with recoveries outside the QC limits on both columns need to be re-extracted and re-analyzed. In addition, the Tetra Tech Statement of Work listed the PCB holding time as "none" for this project. No further action was taken.

On April 11, 2011 the laboratory clarified that all TCMX results were removed from the PCB section of the data package in the resubmitted package since TCMX is not applicable to the PCB analysis. On April 12, 2011 the laboratory submitted all revised forms.

On April 6, 2011 the laboratory resubmitted select PCB initial calibration pages since the original pages did not have the correct analysis date and the data set was not complete. On April 12, 2011 the laboratory resubmitted the affected forms to correct the page numbers since the page numbers were not correct in the resubmittal.

#### PAH

On April 18, 2011 the laboratory informed Tetra Tech that a calibration error for low-level PAHs affected the soil samples in this SDG. The reported LOQs were not supported by the low standard of the calibration curve. On April 19, 2011 the laboratory resubmitted the Analysis Data Sheets (Form 1s) for all PAH samples in this SDG to show the correct LOQs. The data summary tables were edited to include additional "J" values due to a higher LOQ. The edited data summary tables have been added to the data validation memorandum.

# **Initial and Continuing Calibrations**

#### **Volatiles**

The following table summarizes the volatile compounds that failed to meet the continuing calibration (CC) criterion of D < 20 for CCCs and D < 25 for all other compounds:

Compound	%D	Action		Affected Samples
Compound	70D	(+)	NDs	Affected Samples
Acetone	34.1	-	UJ	
Bromodichloromethane	28.6		UJ	
Carbon tetrachloride	36.3		UJ	All comples
1,2-Dichloroethane	39.1		UJ	All samples
1,1,1-Trichloroethane	32.0		UJ	
Trichlorotrifluoromethane	27.2		UJ	

Although the %D was outside of the QC limit for acetone, bromodichloromethane, carbon tetrachloride, 1,2-dichloroethane, 1,1,1-trichloroethane, and trichlorotrifluoromethane; the project accuracy goals are not impacted since the affected sample results are more than an order of magnitude below the PAL or there are no regulatory limits established for the compounds. Also, there are no regulatory limits established for the trip blank sample. The non-detected acetone, bromodichloromethane, carbon tetrachloride, 1,2-dichloroethane, 1,1,1-trichloroethane, and trichlorotrifluoromethane results in the affected samples are usable as estimated values.

#### GRO

The following table summarizes the hydrocarbon range that failed to meet the continuing calibration (CC) criterion of %D <20:

Hudroperhan Rango	%D	Action	Affected Sample
Hydrocarbon Range	70D	(+) NDs	Affected Sample
GRO	-71.7	UJ	DSY-SO-SB214-0203RE

Although the %D was outside of the QC limit for GRO, the project accuracy goals are not impacted since the affected sample result is more than an order of magnitude below the PAL. The non-detected GRO result in the affected sample is usable as an estimated value.

#### **PCB**

The following table summarizes the Aroclor that failed to meet the continuing calibration (CC) criterion of %D <20:

Aroclor	Col. 1	Col. 2	Ac	tion	Affected Samples
Arocioi	%D	%D	(+)	NDs	Affected Samples
Aroclor-1016	21.44, 21.04, 27.14	-26.82, -26.68, -28.42		ΟĴ	All samples except DSY-SO-SB213-0203, DSY-SO-SB214-0203

Although the %D was outside of the QC limit for Aroclor-1016, the project accuracy goals are not impacted since the affected sample results are more than an order of magnitude below the PAL. The non-detected Aroclor-1016 results in the affected samples are usable as estimated values.

#### **Surrogate Compounds**

#### **PCB**

The following sample had surrogate spike recoveries outside of the recovery limits:

Comple		QC Limits: 60-125)	Ac	tion
Sample	Column 1	Column 2	(+)	NDs
DSY-SO-SB214-0203	37.2	36.5		UJ

Although the surrogate recovery QC criteria were not met for decachlorobiphenyl (DCB) in the affected sample, the project accuracy goals are not impacted since the sample results are more than an order of magnitude below the PALs. The non-detected PCB Aroclor results in sample DSY-SO-SB214-0203 are usable as estimated values which may be biased low.

# Matrix Spike/Matrix Spike Duplicate

#### PAH

The following table summarizes the results of the matrix spike and/or matrix spike duplicate (MS/MSD) analysis of sample DSY-SO-SB208-000.5 that were outside of the QC limit:

Compound	MS/MSD	%Rec.	RPD	RPD	A	ction
Compound	%Rec.	QC Limits	nru	QC Limit	(+)	NDs
Benzo(a)anthracene	-20.3/-23.6	31-146	-	-	J	
Benzo(a)pyrene	-9.25/-7.96	28-128	-	-	J	
Benzo(b)fluoranthene	-52.1/-42.8	30-139	-	-	J	
Chrysene	-34.4/-41.9	39-134	-	•	J	
Phenanthrene	-97.5/-127	32-127	-	-	J	
Pyrene	-78.7/-89.7	28-130	-	-	J	
Benzo(g,h,i)perylene	-/14.2	21-149	-	-	J	
2-Methylnaphthalene	-	-	38.0	30	J	
Naphthalene		_	41.6	30	J	

<sup>-</sup>Criterion met

The MS/MSD recoveries for benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and chrysene did not meet the QC limit; therefore, the project accuracy goals may be impacted. The positive benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and chrysene results in sample DSY-SO-SB208-000.5 are usable as estimated values which may be biased low.

Although the MS/MSD recoveries for phenanthrene, pyrene, and benzo(g,h,i)perylene did not meet the QC limit; the project accuracy goals are not impacted since the affected sample results are more than an order of magnitude below the PALs. The positive phenanthrene, pyrene, and benzo(g,h,i)perylene results in sample DSY-SO-SB208-000.5 are usable as estimated values which may be biased low.

Although the MS/MSD relative percent differences for 2-methylnaphthalene and naphthalene did not meet the QC limits; the project precision goals are not impacted since the affected sample results are more than an order of magnitude below the PALs. The positive 2-methylnaphthalene and naphthalene results in sample DSY-SO-SB208-000.5 are usable as estimated values for which the bias is indeterminate.

#### **Field Duplicates**

#### No.

PAH

The field duplicate pair DSY-SO-SB208-000.5/DSY-SO-DUP02-0211 exceeded the relative percent difference QC criterion of 50% for the following compounds:

Analyta	Sample Result	Duplicate Result	RPD	Ac	tion
Analyte	(μg/kg)	(μg/kg)	NPD	(+)	NDs
Anthracene	45.1	3.94 U	NC	J	UJ
Acenaphthene	36.7	10.0	114	J	
Benzo(a)anthracene	149	51.5	97	J	
Benzo(a)pyrene	129	46.3	94	J	
Benzo(b)fluoranthene	194	67.4	63	J	
Benzo(g,h,i)perylene	59.5	28.4	71	J	
Benzo(k)fluoranthene	71.2	28.8	85	J	
Chrysene	161	48.1	108	J	
Fluoranthene	3650	103	109	J	
Indeno(1,2,3-cd)pyrene	55.1	23.5	80	J	
2-Methylnaphthalene	33.1	18.8	55	J	

Analyta	Sample Result	Duplicate Result	RPD	Action		
Analyte	(µg/kg)	(μg/kg)	RPD	(+)	NDs	
Phenanthrene	280	77.9	113	J		
Pyrene	264	79.1	108	J		

J – Result is estimated.

In addition, the sample result for anthracene is greater than 2x the limit of quantitation (LOQ) while the duplicate result is non-detect.

The field duplicate relative percent difference for the compounds listed above exceeded the QC criterion; therefore, the project precision goals may be impacted. The affected positive and non-detected results in samples DSY-SO-SB208-000.5 and DSY-SO-DUP02-0211 are usable as estimated values for which the bias is indeterminate.

### Analyte Identification/Quantitation

#### **PCB**

The %RPD between the results of analytical columns 1 and 2 exceeded the 40% RPD QC criterion for the compounds in the following samples:

Sample	Analyte	%RPD	Action (+)
DSY-SO-DUP02-0211	Aroclor-1260	51	J
DSY-SO-SB208-000.5	Aroclor-1260	56	J
DSY-SO-SB209-0.30.7	Aroclor-1260	62	J

The analyte quantitation relative percent differences exceeded the 40% RPD QC limit for the sample listed above; therefore, the project accuracy goals may be affected due to analytical interferences detected in the dual column analysis. The positive Aroclor-1260 results in the affected samples are usable as estimated values.

#### **Limits of Detection**

All non-detected results were reported at the limit of detection (LOD). Positive results above the detection limit (DL) and below the limit of quantitation (LOQ) were qualified as estimated (J) due to uncertainty below the LOQ. Project action limits (PALs) were evaluated for non-detected results (reported at the LOD) only.

There are no PALs established for the trip blank samples.

#### **Volatiles**

All PALs for the groundwater samples were met by the LODs except for 1,2-dibromo-3-chloropropane and 1,2-dibromoethane. Data usability may be impacted for these compounds for the groundwater samples.

U – Not detected.

NC - Not calculated.

#### PAH/DRO/GRO/PCB

All PALs for PAH, DRO, GRO, and PCBs for the soil samples were met by the LODs.

# **Analytical Data Usability Assessment**

The data usability assessment was performed to determine if the analytical data reported by the laboratory for this SDG met the project data quality objectives for acceptable accuracy, precision, sensitivity, and completeness; and to determine and define the impact of the exceeded quality control indicators on the technical usability of the data. Please refer to the specific sections in the above validation report for further details.

This is a partial evaluation based on laboratory quality control (QC) and limited field information available at the time of the assessment. A comprehensive project data usability assessment will be performed later when all data are available.

#### **Volatiles**

The project goals with respect to accuracy were met for the volatiles data set. Acetone, bromodichloromethane, carbon tetrachloride, 1,2-dichloroethane, 1,1,1-trichloroethane, and trichlorotrifluoromethane were qualified as estimated in all samples due to poor instrument calibration variability. Although specific method criteria were not met in this instance, data usability is not impacted and the affected non-detected results are usable as estimated values.

The project goals with respect to sensitivity were met for the volatiles data set with the following exception. All PALs for the groundwater samples were met by the LODs except for 1,2-dibromo-3-chloropropane and 1,2-dibromoethane. Data usability may be impacted for these compounds for the groundwater samples.

The project goals with respect to precision and laboratory data completeness were met for the volatiles data set. Data usability is not impacted with regards to precision and laboratory data completeness.

# PAH

The project goals with respect to accuracy were met for the PAH data set with the following exception. Benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and chrysene were qualified as estimated in sample DSY-SO-SB208-000.5 due to low MS/MSD recoveries; the affected results may be biased low. Although specific method criteria were not met in this instance, the affected positive results are usable as estimated values which may have a minor impact on data usability. In addition, phenanthrene, pyrene, and benzo(g,h,i)perylene were qualified as estimated in sample DSY-SO-SB208-000.5 due to low MS/MSD recoveries. Although specific method criteria were not met in this instance, data usability is not impacted and the affected positive results are usable as estimated values.

The project goals with respect to precision were met for the PAH data set with the following exception. Several compounds were qualified as estimated in samples DSY-SO-SB208-000.5 and DSY-SO-DUP02-0211 due to poor field duplicate precision. Although specific QC criteria were not met in this instance, the affected positive and non-detected results are usable as estimated values which may have a minor impact on data usability. In addition, 2-methylnaphthalene and naphthalene were qualified as estimated in sample DSY-SO-SB208-000.5 due to poor MS/MSD precision. Although specific method

criteria were not met in this instance, data usability is not impacted and the affected positive results are usable as estimated values.

The project goals with respect to sensitivity and laboratory data completeness were met for the PAH data set. Data usability is not impacted with regards to sensitivity and laboratory data completeness.

#### **PCB**

The project goals with respect to accuracy were met for the PCB data set with the following exception. Aroclor-1260 was qualified as estimated in select samples due to analytical interferences detected in the dual column analysis. Although specific method criteria were not met in this instance, the affected positive results are usable as estimated values which may have a minor impact on data usability. In addition, Aroclor-1016 was qualified as estimated in select samples due to poor instrument calibration variability. Sample DSY-SO-SB214-0203 was qualified as estimated due to low surrogate recoveries. Although specific method criteria were not met in these instances, data usability is not impacted and the affected positive and non-detected results are usable as estimated values.

The project goals with respect to precision, sensitivity, and laboratory data completeness were met for the PCB data set. Data usability is not impacted with regards to precision, sensitivity, and laboratory data completeness.

#### **GRO**

The project goals with respect to accuracy were met for the GRO data set. GRO was qualified as estimated in sample DSY-SO-SB214-0203RE due to poor instrument calibration variability. Although specific method criteria were not met in this instance, data usability is not impacted and the affected non-detected results are usable as estimated values.

The project goals with respect to precision, sensitivity, and laboratory data completeness were met for the GRO data set. Data usability is not impacted with regards to precision, sensitivity, and laboratory data completeness.

#### DRO

The project goals with respect to accuracy, precision, sensitivity, and laboratory data completeness were met for the DRO data set. Data usability is not impacted with regards to accuracy, precision, sensitivity, and laboratory data completeness.

Data Validation Qualifiers and Codes

Enclosures:

Data Validation Worksheets

# Data Validation Qualifiers and Codes

#### **Data Validation Qualifiers:**

= No qualifier attached to value (positive hit)

J = Value is estimated

= Value is not detected

UJ = Value is not detected and estimated

R = Value (positive hit) is not usable

UR = Value was reported as ND but is not usable

#### **Qualifier Codes:**

A = Lab Blank Contamination

B = Field Blank Contamination

C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)

C01 = GC/MS Tuning Noncompliance

D = MS/MSD Recovery Noncompliance

E = LCS/LCSD Recovery Noncompliance

F = Lab Duplicate Imprecision

G = Field Duplicate Imprecision

H = Holding Time Exceedance

1 = ICP Serial Dilution Noncompliance

J = GFAA PDS - GFAA MSA's r < 0.995

K = ICP Interference - includes ICS % R Noncompliance

L = Instrument Calibration Range Exceedance

M = Sample Preservation Noncompliance

N = Internal Standard Noncompliance

N01 = Internal Standard Recovery Noncompliance Dioxins

N02 = Recovery Standard Noncompliance Dioxins

N03 = Clean-up Standard Noncompliance Dioxins

O = Poor Instrument Performance (e.g. base-line drifting)

P = Uncertainty below quantitation limit (< QL but ≥ MDL)

Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)

R = Surrogates Recovery Noncompliance

S = Pesticide/PCB Resolution

T = % Breakdown Noncompliance for DDT and Endrin

U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC

V = Non-linear calibrations; correlation coefficient r < 0.995

W = EMPC result

X = Signal to noise response drop

Y = Percent solids <30%

Z = Uncertainty at 2 sigma deviation is greater than sample activity

DSY-GW-MW218-030111

Tetra Tech NUS, Inc. (TtNUS) performed a Tier II data validation on the volatile organic compounds (VOC) and polycyclic aromatic hydrocarbons (PAH) analytical data for the samples in this SDG. The samples were collected at the On-Shore Derecktor Shipyard, Site 19 at NAVSTA Newport, Newport, RI from February 26 – March 2, 2011. Sample collection and analysis were performed according to the Work Plan Addendum 1 for Study Area Screening Evaluation, On-Shore Derecktor Shipyard, Site 19, NAVSTA Newport, Newport, Rhode Island; dated February 2011.

The VOC analysis was performed according to USEPA SW-846 Method 8260B. The PAH analysis was performed according to USEPA SW-846 Method 8270C.

The project specific criteria listed in the site Work Plan Addendum 1 were applied for validation of the data, including project action limits (PALs). The data user should consider the most recent revisions to the applicable regulatory limits. The VOC and PAH data validation was performed in accordance with the Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses, December 1996.

The sample results, validation qualifiers (VQL), and qualifier codes (QLCD) are presented in the enclosed data summary tables. A list of the qualifier codes, which provide the reasons for the validation qualifiers, is enclosed.

The data were evaluated based on the following parameters:

- Laboratory Data Completeness
- Preservation and Technical Holding Times
- GC/MS Instrument Performance Check (Tuning)

- Initial and Continuing Calibrations
  - Blanks
- Surrogate Compounds
  - Internal Standards
    - Matrix Spike/Matrix Spike Duplicate
  - Laboratory Control Sample/Laboratory Control Sample Duplicate
- Field Duplicates
  - Limits of Detection
    - \* All criteria were met for this parameter.

# **Laboratory Data Completeness**

Sample ID DSY-GW-TB01-030111 has the suffix "-030111", however, the sample date for this sample is February 26, 2011 per the chain-of-custody form. No further action was taken.

### **Volatiles**

On April 12, 2011 the laboratory resubmitted the preparation bench sheets for the volatile samples to show that the pH of the samples was  $\leq 2$  since this was not provided in the original data package.

## **Blanks**

### PAH

The following table summarizes the level of blank contamination detected in the method blank associated with the samples.

Compound	Type of Blank	Maximum Conc. (μg/L)	Action Level (µg/L)	Affected Sample
Benzo(a)anthracene	Method	0.215	1.075	DSY-GW-MW218-030111

Blank action was applied to the affected groundwater sample due to benzo(a)anthracene method blank contamination. The 5x rule applies for this compound. Positive results below the blank action levels were changed to non-detected values (U) at the sample results.

Although benzo(a)anthracene contamination were found in the method blank, the project sensitivity goals are not impacted since there are no PALs established for benzo(a)anthracene for the groundwater samples. The benzo(a)anthracene result in the affected sample is usable as a non-detected value.

## Matrix Spike/Matrix Spike Duplicate

## **Volatiles**

The following table summarizes the results of the matrix spike and/or matrix spike duplicate (MS/MSD) analysis of sample DSY-GW-MW08-030111 that were outside of the QC limit:

Analyto	RPD	RPD	Д	ction
Analyte	NED	QC Limit	(+)	NDs
Chloroethane	32.7	30		UJ

Although the MS/MSD relative percent difference for chloroethane did not meet the QC limit; the project precision goals are not impacted since the affected sample result is more than an order of magnitude below the PAL. The non-detected chloroethane result in sample DSY-GW-MW08-030111 is usable as an estimated value for which the bias is indeterminate.

## **Limits of Detection**

All non-detected results were reported at the limit of detection (LOD). Positive results above the detection limit (DL) and below the limit of quantitation (LOQ) were qualified as estimated (J) due to uncertainty below the LOQ. Project action limits (PALs) were evaluated for non-detected results (reported at the LOD) only.

There are no PALs established for the trip blank sample.

### **Volatiles**

All PALs were met by the LODs except for 1,2-dibromo-3-chloropropane and 1,2-dibromoethane. Data usability may be impacted for these compounds for the groundwater samples.

### PAH

All PALs were met by the LODs.

Benzo(a)anthracene in sample DSY-GW-MW218-030111 was changed to a non-detected value due to blank contamination. As discussed above in the Blanks section, data usability is not impacted.

## **Analytical Data Usability Assessment**

The data usability assessment was performed to determine if the analytical data reported by the laboratory for this SDG met the project data quality objectives for acceptable accuracy, precision, sensitivity, and completeness; and to determine and define the impact of the exceeded quality control indicators on the technical usability of the data. Please refer to the specific sections in the above validation report for further details.

This is a partial evaluation based on laboratory quality control (QC) and limited field information available at the time of the assessment. A comprehensive project data usability assessment will be performed later when all data are available.

## **Volatiles**

The project goals with respect to precision were met for the volatiles data set. Chloroethane was qualified as estimated in sample DSY-GW-MW08-030111 due to poor MS/MSD precision. Although specific method criteria were not met in this instance, data usability is not impacted and the affected non-detected result is usable as an estimated value.

The project goals with respect to sensitivity were met for the volatiles data set with the following exception. All PALs were met by the LODs except for 1,2-dibromo-3-chloropropane and 1,2-dibromoethane. Data usability may be impacted for these compounds for the groundwater samples.

The project goals with respect to accuracy and laboratory data completeness were met for the volatiles data set. Data usability is not impacted with regards to accuracy and laboratory data completeness.

## PAH

The project goals with respect to accuracy, precision, sensitivity, and laboratory data completeness were met for the PAH data set. Data usability is not impacted with regards to accuracy, precision, sensitivity, and laboratory data completeness.

Data Summary Tables

Data Validation Qualifiers and Codes

Enclosures:

Data Validation Worksheets

# Data Validation Qualifiers and Codes

### **Data Validation Qualifiers:**

= No qualifier attached to value (positive hit)

J = Value is estimated

U = Value is not detected

UJ = Value is not detected and estimated

R = Value (positive hit) is not usable

UR = Value was reported as ND but is not usable

### **Qualifier Codes:**

A = Lab Blank Contamination

B = Field Blank Contamination

C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)

C01 = GC/MS Tuning Noncompliance

D = MS/MSD Recovery Noncompliance

E = LCS/LCSD Recovery Noncompliance

F = Lab Duplicate Imprecision

G = Field Duplicate Imprecision

H = Holding Time Exceedance

1 = ICP Serial Dilution Noncompliance

J = GFAA PDS - GFAA MSA's r < 0.995

K = ICP Interference - includes ICS % R Noncompliance

L = Instrument Calibration Range Exceedance

M = Sample Preservation Noncompliance

N = Internal Standard Noncompliance

N01 = Internal Standard Recovery Noncompliance Dioxins

N02 = Recovery Standard Noncompliance Dioxins

N03 = Clean-up Standard Noncompliance Dioxins

O = Poor Instrument Performance (e.g. base-line drifting)

P = Uncertainty below quantitation limit (< QL but ≥ MDL)

Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)

R = Surrogates Recovery Noncompliance

S = Pesticide/PCB Resolution

T = % Breakdown Noncompliance for DDT and Endrin

U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC

V = Non-linear calibrations; correlation coefficient r < 0.995

W = EMPC result

X = Signal to noise response drop

Y = Percent solids <30%

Z = Uncertainty at 2 sigma deviation is greater than sample activity

To:

T. Campbell (w/o enc.)

From:

J. Cardinal (no copy)

Subject:

Tier II Organic Data Validation, SDG CTOWE20\_004

Empirical Laboratories, LLC

CTO WE20, Study Area Screening Evaluation, On-Shore Derecktor Shipyard, Site 19,

NAVSTA Newport, Newport, Rhode Island

VOC:

1/Groundwater/

DSY-GW-MW12-030311

VOC/GRO:

1/Trip Blank/

DSY-GW-TB01-030311

VOC/PAH/DRO/GRO/PCB:

1/Rinsate Blank/

DSY-SO-RB01-0311

Tetra Tech NUS, Inc. (TtNUS) performed a Tier II data validation on the volatile organic compounds (VOC), polycyclic aromatic hydrocarbons (PAH), polychlorinated biphenyls (PCB), diesel range organic (DRO; C8-C40), and gasoline range organic (GRO; C6-C10) analytical data for the samples in this SDG. The samples were collected at the On-Shore Derecktor Shipyard, Site 19 at NAVSTA Newport, Newport, RI from March 3-8, 2011. Sample collection and analysis were performed according to the Work Plan Addendum 1 for Study Area Screening Evaluation, On-Shore Derecktor Shipyard, Site 19, NAVSTA Newport, Newport, Rhode Island; dated February 2011.

The VOC analysis was performed according to USEPA SW-846 Method 8260B. The PAH analysis was performed according to USEPA SW-846 Method 8270C. The PCB analysis was performed according to USEPA SW-846 Method 8082A. The DRO and GRO analyses were performed according to USEPA SW-846 Method 8015B.

The project specific criteria listed in the site Work Plan Addendum 1 were applied for validation of the data, including project action limits (PALs). The data user should consider the most recent revisions to the applicable regulatory limits. The VOC, PAH, GRO, and DRO data validation was performed in accordance with the <a href="Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses">Region I EPA-NE Data Validation Functional Guidelines for Evaluating Organic Analyses</a>, Part III, February 2004.

The sample results, validation qualifiers (VQL), and qualifier codes (QLCD) are presented in the enclosed data summary tables. A list of the qualifier codes, which provide the reasons for the validation qualifiers, is enclosed.

The data were evaluated based on the following parameters:

Laboratory Data Completeness

- Preservation and Technical Holding Times
  - GC/MS Instrument Performance Check (Tuning)
  - Initial and Continuing Calibrations
  - Blanks
- Surrogate Compounds
  - Internal Standards
- NA Matrix Spike/Matrix Spike Duplicate
- Laboratory Control Sample/Laboratory Control Sample Duplicate
- NA Field Duplicates
  - Analyte Identification/Quantitation
  - Limits of Detection
    - \* All criteria were met for this parameter. NA Not applicable for this SDG.

# **Laboratory Data Completeness**

Although trip blank sample ID DSY-GW-TB01-030311 has the suffix "-030311", the sample was collected on March 8, 2011 according to the chain-of-custody form. This trip blank is associated with the groundwater sample collected on March 3, 2011. No further action was taken.

On April 6, 2011 the laboratory resubmitted all of the Analysis Data Sheets (Form 1s) for all samples for all fractions in this SDG to correct the sample dates of the samples since the sample dates were incorrect in the original data package.

## GRO

On April 18, 2011 the laboratory resubmitted the GRO logbook pages to show that pH was <2 for all GRO samples since the pH of the samples was not included in the original data package.

## **Initial and Continuing Calibrations**

## **Volatiles**

The following table summarizes the volatile compounds that failed to meet the continuing calibration (CC) criterion of %D <25:

Compound	%D	Ac	tion	Affected Comples
Compound	70D	(+)	NDs	Affected Samples
Carbon tetrachloride	32.4		UJ	
Cyclohexane	29.5		UJ	Alloomaloo
cis-1,3-Dichloropropene	28.2		UJ	All samples
Methylcyclohexane	28.4		UJ	

Although the %D was outside of the QC limit for carbon tetrachloride, cyclohexane, cis-1,3-dichloropropene, and methylcyclohexane; the project accuracy goals are not impacted since the affected groundwater sample results are more than an order of magnitude below the PAL and there are no regulatory limits established for the rinsate and trip blank samples. The non-detected carbon tetrachloride,

cyclohexane, cis-1,3-dichloropropene, and methylcyclohexane results in the affected samples are usable as estimated values.

### PAH

The following table summarizes the PAH compounds that failed to meet the continuing calibration (CC) criterion of %D <20:

Compound	0/ D	Action	Affacted Comple
Compound	%D	(+) NDs	Affected Sample
Benzo(a)anthracene	-25.5	UJ	DSY-SO-RB01-0311

Although the %D was outside of the QC limit for benzo(a)anthracene; the project accuracy goals are not impacted since there are no regulatory limits established for the rinsate blank sample. The non-detected benzo(a)anthracene result in the affected sample is usable as an estimated value.

## **Limits of Detection**

All non-detected results were reported at the limit of detection (LOD). Positive results above the detection limit (DL) and below the limit of quantitation (LOQ) were qualified as estimated (J) due to uncertainty below the LOQ. Project action limits (PALs) were evaluated for non-detected results (reported at the LOD) only.

There are no PALs established for the rinsate and trip blank samples.

## **Volatiles**

All PALs were met by the LODs except for 1,2-dibromo-3-chloropropane and 1,2-dibromoethane. Data usability may be impacted for these compounds for the groundwater sample.

## **Analytical Data Usability Assessment**

The data usability assessment was performed to determine if the analytical data reported by the laboratory for this SDG met the project data quality objectives for acceptable accuracy, precision, sensitivity, and completeness; and to determine and define the impact of the exceeded quality control indicators on the technical usability of the data. Please refer to the specific sections in the above validation report for further details.

This is a partial evaluation based on laboratory quality control (QC) and limited field information available at the time of the assessment. A comprehensive project data usability assessment will be performed later when all data are available.

### Volatiles

The project goals with respect to accuracy were met for the volatiles data set. Carbon tetrachloride, cyclohexane, cis-1,3-dichloropropene, and methylcyclohexane were qualified as estimated in select samples due to poor instrument calibration variability. Although specific method criteria were not met in this instance, data usability is not impacted and the affected non-detected results are usable as estimated values.

The project goals with respect to precision could not be fully evaluated for the volatiles data set since no precision-based QC was analyzed for the volatiles analysis in this SDG.

The project goals with respect to sensitivity were met for the volatiles data set with the following exception. All PALs were met by the LODs except for 1,2-dibromo-3-chloropropane and 1,2-dibromoethane. Data usability may be impacted for these compounds for the groundwater sample.

The project goals with respect to laboratory data completeness were met for the volatiles data set. Data usability is not impacted with regards to laboratory data completeness.

### PAH/PCB/GRO/DRO

The PAH, PCB, GRO, and DRO data sets was not assessed for data usability since there are no quality control indicators established for the rinsate and trip blank samples.

Tables:

**Data Summary Tables** 

Data Validation Qualifiers and Codes

Enclosures:

Data Validation Worksheets

# Data Validation Qualifiers and Codes

### **Data Validation Qualifiers:**

= No qualifier attached to value (positive hit)

J = Value is estimated

U = Value is not detected

UJ = Value is not detected and estimated

R = Value (positive hit) is not usable

UR = Value was reported as ND but is not usable

### **Qualifier Codes:**

A = Lab Blank Contamination

B = Field Blank Contamination

C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)

C01 = GC/MS Tuning Noncompliance

D = MS/MSD Recovery Noncompliance

E = LCS/LCSD Recovery Noncompliance

F = Lab Duplicate Imprecision

G = Field Duplicate Imprecision

H = Holding Time Exceedance

I = ICP Serial Dilution Noncompliance

J = GFAA PDS - GFAA MSA's r < 0.995

K = ICP Interference - includes ICS % R Noncompliance

L = Instrument Calibration Range Exceedance

M = Sample Preservation Noncompliance

N = Internal Standard Noncompliance

N01 = Internal Standard Recovery Noncompliance Dioxins

N02 = Recovery Standard Noncompliance Dioxins

N03 = Clean-up Standard Noncompliance Dioxins

O = Poor Instrument Performance (e.g. base-line drifting)

P = Uncertainty below quantitation limit (< QL but ≥ MDL)

Q = Other problems (can encompass a number of issues; e.g. chromatography, interferences, etc.)

R = Surrogates Recovery Noncompliance

S = Pesticide/PCB Resolution

T = % Breakdown Noncompliance for DDT and Endrin

U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC

V = Non-linear calibrations; correlation coefficient r < 0.995

W = EMPC result

X = Signal to noise response drop

Y = Percent solids <30%

Z = Uncertainty at 2 sigma deviation is greater than sample activity

DSY-GW-RB01-031611

Tetra Tech NUS, Inc. (TtNUS) performed a Tier II data validation on the volatile organic compounds (VOC) and polycyclic aromatic hydrocarbons (PAH) analytical data for the samples in this SDG. The samples were collected at the On-Shore Derecktor Shipyard, Site 19 at NAVSTA Newport, Newport, RI from March 16-17, 2011. Sample collection and analysis were performed according to the Work Plan Addendum 1 for Study Area Screening Evaluation, On-Shore Derecktor Shipyard, Site 19, NAVSTA Newport, Newport, Rhode Island; dated February 2011.

The VOC analysis was performed according to USEPA SW-846 Method 8260B. The PAH analysis was performed according to USEPA SW-846 Method 8270C.

The project specific criteria listed in the site Work Plan Addendum 1 were applied for validation of the data, including project action limits (PALs). The data user should consider the most recent revisions to the applicable regulatory limits. The VOC and PAH data validation was performed in accordance with the Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses, December 1996.

The sample results, validation qualifiers (VQL), and qualifier codes (QLCD) are presented in the enclosed data summary tables. A list of the qualifier codes, which provide the reasons for the validation qualifiers, is enclosed.

The data were evaluated based on the following parameters:

- Laboratory Data Completeness
- Preservation and Technical Holding Times

Memo to T. Campbell May 03, 2011 Page 2

- GC/MS Instrument Performance Check (Tuning)
  - Initial and Continuing Calibrations
  - Blanks
  - Surrogate Compounds
- Internal Standards
- NA
- Matrix Spike/Matrix Spike Duplicate
- Laboratory Control Sample/Laboratory Control Sample Duplicate
- Field Duplicates
  - Limits of Detection
    - \* All criteria were met for this parameter. NA Not applicable for this SDG.

# **Laboratory Data Completeness**

The laboratory mistakenly logged in sample DSY-GW-MW204-**031711** with the suffix "-031611" and the sample date 3/16/11 (actual sample date is 3/17/11). On April 25, 2011 the laboratory resubmitted all affected forms to correct the sample ID and sample date.

### **Volatiles**

On April 19, 2011 the laboratory resubmitted the VOC logbook pages to show that the pH was <2 for all VOC samples since this information was not included in the original data package.

# **Initial and Continuing Calibrations**

### **Volatiles**

The following table summarizes the volatile compounds that failed to meet the continuing calibration (CC) criterion of %D <25:

Compound	0/ D	Ac	tion	Affastad Camples
Compound	%D	(+)	NDs	Affected Samples
Chloroethane	26.7		UJ	All samples
Dichlorodifluoromethane	46.7		UJ	All samples

Although the %D was outside of the QC limit for chloroethane and dichlorodifluoromethane, the project accuracy goals are not impacted since there are no project action limits established for these compounds for the samples in this SDG. The non-detected chloroethane and dichlorodifluoromethane results in the affected samples are usable as estimated values.

## **Limits of Detection**

All non-detected results were reported at the limit of detection (LOD). Positive results above the detection limit (DL) and below the limit of quantitation (LOQ) were qualified as estimated (J) due to uncertainty below the LOQ. Project action limits (PALs) were evaluated for non-detected results (reported at the LOD) only.

There are no PALs established for the rinsate and trip blank samples.

Memo to T. Campbell May 03, 2011 Page 3

## **Volatiles**

All PALs were met by the LODs except for 1,2-dibromo-3-chloropropane and 1,2-dibromoethane. Data usability may be impacted for these compounds for the groundwater samples.

## **PAHs**

All the PALs were met by the LOD values.

# **Analytical Data Usability Assessment**

The data usability assessment was performed to determine if the analytical data reported by the laboratory for this SDG met the project data quality objectives for acceptable accuracy, precision, sensitivity, and completeness; and to determine and define the impact of the exceeded quality control indicators on the technical usability of the data. Please refer to the specific sections in the above validation report for further details.

This is a partial evaluation based on laboratory quality control (QC) and limited field information available at the time of the assessment. A comprehensive project data usability assessment will be performed later when all data are available.

### **Volatiles**

The project goals with respect to accuracy were met for the volatiles data set. Chloroethane and dichlorodifluoromethane were qualified as estimated in select samples due to poor instrument calibration variability. Although specific method criteria were not met in this instance, data usability is not impacted and the affected non-detected results are usable as estimated values.

The project goals with respect to sensitivity were met for the volatiles data set with the following exception. All PALs were met by the LODs except for 1,2-dibromo-3-chloropropane and 1,2-dibromoethane. Data usability may be impacted for these compounds for the groundwater samples.

The project goals with respect to precision and laboratory data completeness were met for the volatiles data set. Data usability is not impacted with regards to precision and laboratory data completeness.

# **PAH**

The project goals with respect to accuracy, precision, sensitivity, and laboratory data completeness were met for the PAH data set. Data usability is not impacted with regards to accuracy, precision, sensitivity, and laboratory data completeness.

Tables:

Data Summary Tables

Data Validation Qualifiers and Codes

**Enclosures:** 

**Data Validation Worksheets** 

# Data Validation Qualifiers and Codes

### **Data Validation Qualifiers:**

= No qualifier attached to value (positive hit)

J = Value is estimated

U = Value is not detected

UJ = Value is not detected and estimated

R = Value (positive hit) is not usable

UR = Value was reported as ND but is not usable

### **Qualifier Codes:**

A = Lab Blank Contamination

B = Field Blank Contamination

C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)

C01 = GC/MS Tuning Noncompliance

D = MS/MSD Recovery Noncompliance

E = LCS/LCSD Recovery Noncompliance

F = Lab Duplicate Imprecision

G = Field Duplicate Imprecision

H = Holding Time Exceedance

I = ICP Serial Dilution Noncompliance

J = GFAA PDS - GFAA MSA's r < 0.995

K = ICP Interference - includes ICS % R Noncompliance

L = Instrument Calibration Range Exceedance

M = Sample Preservation Noncompliance

N = Internal Standard Noncompliance

N01 = Internal Standard Recovery Noncompliance Dioxins

N02 = Recovery Standard Noncompliance Dioxins

N03 = Clean-up Standard Noncompliance Dioxins

O = Poor Instrument Performance (e.g. base-line drifting)

P = Uncertainty below quantitation limit (< QL but ≥ MDL)

Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)

R = Surrogates Recovery Noncompliance

S = Pesticide/PCB Resolution

T = % Breakdown Noncompliance for DDT and Endrin

U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC

V = Non-linear calibrations; correlation coefficient r < 0.995

W = EMPC result

X = Signal to noise response drop

Y = Percent solids <30%

Z = Uncertainty at 2 sigma deviation is greater than sample activity

Tetra Tech NUS, Inc. (TtNUS) performed a Tier II data validation on the volatile organic compounds (VOC), polycyclic aromatic hydrocarbons (PAH), diesel range organic (DRO; C8-C40), and gasoline range organic (GRO; C6-C10) analytical data for the samples in this SDG. The samples were collected at the On-Shore Derecktor Shipyard, Site 19 at NAVSTA Newport, Newport, RI from February 9-15, 2011. Sample collection and analysis were performed according to the Work Plan Addendum 1 for Study Area Screening Evaluation, On-Shore Derecktor Shipyard, Site 19, NAVSTA Newport, Newport, Rhode Island; dated February 2011.

The VOC analysis was performed according to USEPA SW-846 Method 8260B. The PAH analysis was performed according to USEPA SW-846 Method 8270C. The DRO and GRO analyses were performed according to USEPA SW-846 Method 8015B.

The project specific criteria listed in the site Work Plan Addendum 1 were applied for validation of the data, including project action limits (PALs) listed in Table A-2. The data user should consider the most recent revisions to the applicable regulatory limits. The VOC, PAH, DRO, and GRO data validation was performed in accordance with the <u>Region I EPA-NE Data Validation Functional Guidelines for Evaluating Environmental Analyses</u>, December 1996.

The sample results, validation qualifiers (VQL), and qualifier codes (QLCD) are presented in the enclosed data summary tables. A list of the qualifier codes, which provide the reasons for the validation qualifiers, is enclosed.

The data were evaluated based on the following parameters:

- Laboratory Data Completeness
- Preservation and Technical Holding Times
- GC/MS Instrument Performance Check (Tuning)
- Initial and Continuing Calibrations
- Blanks
- Surrogate Compounds
- Internal Standards
  - Matrix Spike/Matrix Spike Duplicate
- Laboratory Control Sample/Laboratory Control Sample Duplicate
  - Field Duplicates
  - Percent Solids
    - Limits of Detection
      - \* All criteria were met for this parameter.

# **Laboratory Data Completeness**

### **Volatiles**

On March 17, 2011 the laboratory clarified that DoD limits were applied for the LCS/LCSD and surrogates for the volatiles analysis.

### PAH

Select samples were analyzed at dilution only. On March 17, 2011 the laboratory clarified that samples were diluted due to matrix interferences. These samples were not analyzed at lower dilution. No further action was taken.

On March 17, 2011 the laboratory clarified that the low-level PAH LCS/LCSD and surrogate limits applied are from AFCEE 4.02 as DoD does not address low-level PAHs by Method 8270 as indicated in proposal note 10. No further action was taken.

### DRO

For the DRO samples the limit of quantitation (LOQ) is equal to the detection limit (DL) and limit of detection (LOD). On March 17, 2011 the laboratory clarified that no results are reported less than the LOQ for DRO. No further action was taken.

# **Initial and Continuing Calibrations**

### **Volatiles**

The following table summarizes the volatile compound that failed to meet the initial calibration verification criterion of %D <20%:

Compound	%D	9/ D Action		Affected Samples
Compound	70D	(+)	NDs	Affected Samples
Dichlorodifluoromethane	40.7		UJ	All samples

Although initial calibration verification %D for dichlorodifluoromethane was above the QC limit, the project accuracy goals are not impacted since the affected sample results are more than an order of magnitude below the PAL. The non-detected dichlorodifluoromethane results in the affected samples are usable as estimated values.

The following table summarizes the volatile compounds that failed to meet the continuing calibration (CC) criterion of %D <20 for CCCs or <25% for the other compounds:

Compound	%D	Action		Affected Comples
		(+)	NDs	Affected Samples
Acetone	-25.4	J	UJ	All samples except DSY-SB207-SO-0002 and DSY-SO-TB01-021111
Bromoform	25.6		UJ	DSY-SO-TB01-021111
1,2-Dibromo-3- chloropropane	27.3,		IJ	DSY-SB207-SO-0002
Bromomethane	99.6		UJ	
2-Butanone	27.6		UJ	DSY-SO-TB01-021111
2-Hexanone	30.3		UJ	
Methyl acetate	25.6	J		*

Although the %D was outside of the QC limit for acetone, bromoform, 1,2-dibromo-3-chloropropane, bromomethane, 2-butanone, 2-hexanone, and methyl acetate; the project accuracy goals are not impacted since the affected sample results are below the PAL and there are no regulatory limits established for the trip blank sample. The positive and non-detected acetone, bromoform, 1,2-dibromo-3-chloropropane, bromomethane, 2-butanone, 2-hexanone, and methyl acetate results in the affected samples are usable as estimated values.

### **PAH**

The following table summarizes the PAH compound that failed to meet the continuing calibration (CC) criterion of %D <25:

Compound	%D	Action		Affected Complete
		(+)	NDs	Affected Samples
Benzo(a)anthracene	33.7	J	UJ	All samples

The %D was outside of the QC limit for benzo(a)anthracene; therefore, the project accuracy goals may be impacted. The positive and non-detected benzo(a)anthracene results in the affected samples are usable as estimated values.

## **Blanks**

### **Volatiles**

The following table summarizes the level of blank contamination detected in the trip blank associated with the samples.

Compound	Type of Blank	Maximum Conc. (μg/Kg)	Action Level (μg/Kg)	Affected Samples
Methylene chloride	Trip	8.6	86	All samples except DSY-SO-TB01-021111

Blank actions were applied to the affected soil samples due to methylene chloride trip blank contamination. The 10x rule applies for methylene chloride. Positive results below the blank action levels were changed to non-detected values (U) at the sample results.

Although methylene chloride contamination were found in the trip blank, the project sensitivity goals are not impacted since the non-detected values do not exceed the project action limit for methylene chloride. The methylene chloride results in the affected soil samples are usable as non-detected values.

# **Limits of Detection**

The VOC, GRO, and PAH non-detected results were reported at the limit of detection (LOD). Positive results above the detection limit (DL) and below the limit of quantitation (LOQ) were qualified as estimated (J) due to uncertainty below the LOQ. The non-detected results for are reported at the LOQ. Project action limits (PALs) were evaluated for non-detected results only.

There are no PALs established for the trip blank sample.

### **Volatiles**

All PALs were met by the LODs.

Results for methylene chloride in select samples were changed to non-detected values due to blank contamination. As discussed above in the Blanks section, data usability is not impacted.

### PAH

Samples DSY-SB204-SO-0002, DSY-SB205-SO-0002, DSY-SB207-SO-0002, and DSY-SO-DUP01-021411 were analyzed at 5x dilution.

Memo to T. Campbell April 04, 2011 Page 5

All PALs were met by the LODs except for dibenzo(a,h)anthracene and benzo(a)pyrene. Data usability may be impacted for these compounds for the soil samples.

### **DRO**

The PAL was met by the LOQs.

### GRO

The PAL was met by the LODs.

### Analytical Data Usability Assessment

The data usability assessment was performed to determine if the analytical data reported by the laboratory for this SDG met the project data quality objectives for acceptable accuracy, precision, sensitivity, and completeness; and to determine and define the impact of the exceeded quality control indicators on the technical usability of the data. Please refer to the specific sections in the above validation report for further details.

This is a partial evaluation based on laboratory quality control (QC) and limited field information available at the time of the assessment. A comprehensive project data usability assessment will be performed later when all data are available.

### **Volatiles**

The project goals with respect to accuracy were met for the volatiles data set. Dichlorodifluoromethane was qualified as estimated in select samples due to poor initial calibration verification performance. Acetone, bromoform, 1,2-dibromo-3-chloropropane, bromomethane, 2-butanone, 2-hexanone, and methyl acetate were qualified as estimated in select samples due to instrument calibration variability. Although specific method criteria were not met in these instances, data usability is not impacted and the affected positive and non-detected results are usable as estimated values.

The project goals with respect to precision, sensitivity, and laboratory data completeness were met for the volatiles data set. Data usability is not impacted with regards to precision, sensitivity, and laboratory data completeness.

### PAH

The project goals with respect to accuracy were met for the PAH data set with the following exception. Benzo(a)anthracene was qualified as estimated in all samples due to instrument calibration variability. Although specific method criteria were not met in this instance, the affected positive and non-detected results are usable as estimated values which may have a minor impact on data usability.

The project goals with respect to sensitivity were met for the PAH data set with the following exception. All PALs were met by the LODs except for dibenzo(a,h)anthracene and benzo(a)pyrene. Data usability may be impacted for these compounds for the soil samples.

Memo to T. Campbell April 04, 2011 Page 6

The project goals with respect to precision and laboratory data completeness were met for the PAH data set. Data usability is not impacted with regards to precision and laboratory data completeness.

### **DRO and GRO**

The project goals with respect to accuracy, precision, sensitivity, and laboratory data completeness were met for the DRO and GRO data set. Data usability is not impacted with regards to accuracy, precision, sensitivity, and laboratory data completeness.

Tables:

**Data Summary Tables** 

Data Validation Qualifiers and Codes

**Enclosures:** 

**Data Validation Worksheets** 

### Data Validation Qualifiers and Codes

### **Data Validation Qualifiers:**

= No qualifier attached to value (positive hit)

J = Value is estimated

U = Value is not detected

UJ = Value is not detected and estimated

R = Value (positive hit) is not usable

UR = Value was reported as ND but is not usable

### **Qualifier Codes:**

A = Lab Blank Contamination

B = Field Blank Contamination

C = Calibration Noncompliance (e.g. % RSDs, %Ds, ICVs, CCVs, RRFs, etc.)

C01 = GC/MS Tuning Noncompliance

D = MS/MSD Recovery Noncompliance

E = LCS/LCSD Recovery Noncompliance

F = Lab Duplicate Imprecision

G = Field Duplicate Imprecision

H = Holding Time Exceedance

I = ICP Serial Dilution Noncompliance

J = GFAA PDS - GFAA MSA's r < 0.995

K = ICP Interference - includes ICS % R Noncompliance

L = Instrument Calibration Range Exceedance

M = Sample Preservation Noncompliance

N = Internal Standard Noncompliance

N01 = Internal Standard Recovery Noncompliance Dioxins

N02 = Recovery Standard Noncompliance Dioxins

N03 = Clean-up Standard Noncompliance Dioxins

O = Poor Instrument Performance (e.g. base-line drifting)

P = Uncertainty below quantitation limit (< QL but ≥ MDL)

Q = Other problems (can encompass a number of issues; e.g. chromatography,interferences, etc.)

R = Surrogates Recovery Noncompliance

S = Pesticide/PCB Resolution

T = % Breakdown Noncompliance for DDT and Endrin

U = % Difference between columns/detectors >25% for positive results determined via GC/HPLC

V = Non-linear calibrations; correlation coefficient r < 0.995

W = EMPC result

X = Signal to noise response drop

Y = Percent solids <30%

Z = Uncertainty at 2 sigma deviation is greater than sample activity

#### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.
- 9 Value is for acenaphthene.
- 10 Value is for pyrene.
- Value is for chlordane.
- 12 Value is for hexavalent chromium.
- 13 Value is for mercuric chloride (and other mercury salts).
- 14 Value is for dibutylin and tributyltin.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

### Definitions:

C = Carcinogen

COPC = Chemical Of Potential Concern

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

#### Rationale Codes:

For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:

BKG = Within Background Levels
BSL = Below COPC Screening Level

NTX = No toxicity criteria

NUT = Essential nutrient

#### Footnotes

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011,
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.
- 9 Value is for acenaphthene.
- 10 Value is for pyrene.
- 11 Value is for chlordane.
- 12 Value is for hexavalent chromium.
- 13 Value is for mercuric chloride (and other mercury salts).
- 14 Value is for dibutylin and tributyltin.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

### Definitions:

C = Carcinogen

COPC = Chemical Of Potential Concern

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

#### Rationale Codes:

For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:

BKG = Within Background Levels
BSL = Below COPC Screening Level

NTX = No toxicity criteria

NUT = Essential nutrient

### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 No background data is available for groundwater.
- 5 USEPA Regional Screening Level (RSL). The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag), May 2012.
- 6 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 7 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented. Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

DSY-A-MW04-01

DSY-A-MW11-01 DSY-A-MW12-01

Definitions:

ARAR/TBC = Applicable or Relevant and Appropriate Requirements To Be Considered

C = Carcinogen

CAS = Chemical Abstracts Service

COPC = Chemical Of Potential Concern

EPA-MCL = US Environmental Protection Agency Maximum Contaminant Level (USEPA, 2012)

EPA-SDWR = US Environmental Protection Agency Secondary Drinking Water Regulation (USEPA, 2012)

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

RIDEM = Rhode Island Department of Environmental Management GA Groundwater Objective (November, 2011).

Rationale Codes:

For selection as a COPC:

ASL = Above Screening Level/ARAR/TBC

For elimination as a COPC:

BSL = Below COPC Screening Level

NTX = No toxicity criteria

## TABLE 2.5 OCCURRENCE, DISTRIBUTION, AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - SOIL GAS - NORTH WATERFRONT FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

PAGE 2 OF 2

### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 No background data is available.
- 5 USEPA Vapor Intrusion Screening Level (VISL) Calculator, Version 2.0. May 2012 RSLs. 6 - Value is for 1,2,4-trimethylbenzene.
- 7 Value is for trans-1,2-dichloroethene.
- 8 Value is for m-xylene.
- 9 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

### **Associated Samples**

DSY-SG-MW02A-0708 DSY-SG-MW03-0608

DSY-SG-MW03-0608-D DSY-SG-MW11A-0203

DSY-SG-MW12-0506

### Definitions:

ARAR/TBC = Applicable or Relevant and Appropriate Requirements To Be Considered

C = Carcinogen

COPC = Chemical Of Potential Concern

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

### Rationale Codes:

For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:

BSL = Below COPC Screening Level

NUT = Essential nutrient

NTX = No toxicity criteria

## TABLE 2.6 OCCURRENCE, DISTRIBUTION, AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - DIRECT CONTACT WITH SURFACE SOIL - CENTRAL SHIPYARD FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

PAGE 2 OF 2

### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Value is for pyrene.
- 9 Value is for hexavalent chromium.
- 10 Value is for mercuric chloride (and other mercury salts).
- 11 Value is for dibutylin and tributyltin.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Value is for acenaphthene.
- 9 Value is for pyrene.
- 10 Value is for hexavalent chromium.
- 11 Value is for mercuric chloride (and other mercury salts).
- 12 Value is for dibutylin and tributyltin.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

### Definitions:

C = Carcinogen COPC = Chemical Of Potential Concern

J = Estimated value

N = Noncarcinogen

NA = Not Applicable/Not Available

### Rationale Codes:

For selection as a COPC:

ASL = Above Screening Level.

For elimination as a COPC:

BKG = Within Background Levels BSL = Below COPC Screening Level

NTX = No toxicity criteria

### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 No background data is available for groundwater.
- 5 USEPA Vapor Intrusion Screening Level (VISL) Calculator, Version 2.0. May 2012 RSLs.
- Values correspond to a target cancer risk level of 1E-6 or HI = 0.1 and an attenuation factor of 0.001.
- 6 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

### Associated Samples

DSY-A-MW05-01 DSY-A-MW07-01 DSY-GW-MW218-030111 DSY-GW-MW219-031611-D DSY-GW-MW219-031611-D

### Definitions:

ARAR/TBC = Applicable or Relevant and Appropriate Requirements To Be Considered

C = Carcinogen

CAS = Chemical Abstracts Service

COPC = Chemical Of Potential Concern

J = Estimated value

NA = Not Applicable/Not Available

### Rationale Codes:

For selection as a COPC: ASL = Above Screening Level.

For elimination as a COPC:

BSL = Below COPC Screening Level NTX = No toxicity criteria

NUT = Essential nutrient

NVT = Not sufficiently volatile and/or toxic to pose inhalation risk.

### **TABLE 2.10**

## OCCURRENCE, DISTRIBUTION, AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - DIRECT CONTACT WITH SURFACE SOIL - FORMER BUILDING 234 FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

Footnotes:

PAGE 2 OF 2

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Value is for pyrene.
- 9 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.
- 10 Value is for chlordane.
- 11 Value is for hexavalent chromium.
- 12 Value is for mercuric chloride (and other mercury salts).
- 13 Value is for dibutylin and tributyltin.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

**Associated Samples**

### TABLE 2.11

## OCCURRENCE, DISTRIBUTION, AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - DIRECT CONTACT WITH SUBSURFACE SOIL - FORMER BUILDING 234 FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

PAGE 2 OF 2

Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.
- 9 Value is for pyrene.
- 10 Value is for hexavalent chromium.
- 11 Value is for mercuric chloride (and other mercury salts).
- 12 Value is for dibutylin and tributyltin.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 No background data is available for groundwater.
- 5 USEPA Vapor Intrusion Screening Level (VISL) Calculator, Version 2.0. May 2012 RSLs.
- Values correspond to a target cancer risk level of 1E-6 or HI = 0.1 and an attenuation factor of 0.001.
- 6 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 7 Ten percent of noncarcinogenic screening level is less then the carcinogenic screening level, therefore the noncarcinogenic value is presented.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

### **Associated Samples**

DSY-A-MW08-01 DSY-A-MW08-01-D DSY-A-MW09-01

### Definitions:

ARAR/TBC = Applicable or Relevant and Appropriate Requirements To Be Considered

C = Carcinogen

CAS = Chemical Abstracts Service

COPC = Chemical Of Potential Concern

J = Estimated value

NA = Not Applicable/Not Available

Rationale Codes:

For selection as a COPC: ASL = Above Screening Level.

For elimination as a COPC:

BKG = Within Background Levels
BSL = Below COPC Screening Level

NTX = No toxicity criteria

### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Value is for hexavalent chromium.

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

### **TABLE 2.15**

## OCCURRENCE, DISTRIBUTION, AND SELECTION OF CHEMICALS OF POTENTIAL CONCERN - DIRECT CONTACT WITH SURFACE SOIL - PCB REMOVAL AREA FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

PAGE 2 OF 2

### Footnotes:

- 1 Sample and duplicate are considered as two separate samples when determining the minimum and maximum concentrations.
- 2 Values presented are sample-specific quantitation limits.
- 3 The maximum detected concentration is used for screening purposes.
- 4 Background concentration is upper prediction limit. See Appendix G.
- 5 USEPA Regional Screening Levels for Chemical Contaminants at Superfund Sites, May 2012. The noncarcinogenic values (denoted with a "N" flag) are the screening level divided by 10 to correspond to a target hazard quotient of 0.1. Carcinogenic values represent an incremental cancer risk of 1.0E-06 (carcinogens denoted with a "C" flag).
- 6 Rhode Island Department of Environmental Management (RIDEM), DEM-DSR-01-93, November 2011.
- 7 The chemical is selected as a COPC if the maximum detected concentration exceeds the risk-based COPC screening level.
- 8 Value is for acenaphthene.
- 9 Value is for pyrene.
- 10 Value is for hexavalent chromium.
- 11 Value is for mercuric chloride (and other mercury salts).

Shaded criterion indicates that the maximum detected concentration exceeds one or more screening criteria. Shaded chemical name indicates that the chemical was retained as a COPC.

Exposure Medium: Groundwater

Exposure Point	Chemical of Potential Concern	Units	Arithmetic Mean	95% UCL (Distribution)	Maximum Concentration (Qualifier)	Value	Units	Exposure Point Concentration Statistic	Rationale
North Waterfront	cis-1,2-Dichloroethene	ug/L	1.2	2.3 (N)	4.26	4.26	ug/L	Maximum Detected Concentration	(1)
	Trichloroethene (Mutagenic)	ug/L	4.8	7.9 (N)	12.2	12.2	ug/L	Maximum Detected Concentration	(1)
l	Trichloroethene (Nonmutagenic)	ug/L	4.8	7.9 (N)	12.2	12.2	ug/L	Maximum Detected Concentration	(1)
	Vinyl Chloride	ug/L	(2)	(2)	1.47	1.47	ug/L	Maximum Detected Concentration	(1)
	Aluminum	ug/L	(3)	(3)	337	337	ug/L	Maximum Detected Concentration	(1)
1	Chromium VI	ug/L	(3)	(3)	0.508	0.508	ug/L	Maximum Detected Concentration	(3)
	Iron	ug/L	(3)	(3)	605	605	ug/L	Maximum Detected Concentration	(3)
	Manganese	ug/L	(3)	(3)	53.9	53.9	ug/L	Maximum Detected Concentration	(3)

G - Gamma distribution.

N - Normal distribution.

NP = Nonparametric distribution.

- 1 There are less than four detected concentrations. Reliable statistics cannot be computed. The Maximum concentration was used as the EPC.
- 2 The maximum detected concentration is used as the exposure point concentration for groundwater.
- 3 There are less than five samples. Pro UCL will not calculate any statistics with less than five samples. Maximum Concentration is used for the EPC.

USEPA, 2002: Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites. OSWER 9355.4-24.

USEPA, 2004: Risk Assessment Guidance for Superfund (Part E, Supplemental Guidance for Dermal Risk Assessment) Final. EPA/540/R/99/005.

#### Unit Intake Calculations

Dermal Intake = (SA x EV x EF x ED)/(BW x AT)

Cancer Dermal Intake = 2.40E-01

Noncancer Dermal Intake = 1.68E+01

Cancer risk from dermal contact = Groundwater concentration x Cancer Dermal Intake x DAevent x Dermal Cancer Slope Factor
Hazard Index from dermal contact = Groundwater concentration x Noncancer Dermal Intake x DAevent / Dermal Reference Dose

	1			1	Averaging Time (Non-Cancer)	2,190	days	USEPA, 1989	

#### Notes

1 - Children were evaluated as one age group (0 - 6 years) for non-mutagenic chemicals. For chemicals that act via the mutagenic mode of action, residential children were evaluated as two age groups, 0 - 2 years and 2 - 6 years in accordance with USEPA's Supplemental Guidance of Assessing Susceptibility from Early-Life Exposure to Carcinogens (USEPA, 2005).

#### Sources:

USEPA, 1989: Risk Assessment Guidance for Superfund, Vol 1: Human Health Evaluation Manual, Part A. EPA/540/1-86/060.

USEPA, 1997: Exposure Factors Handbook. EPA/600/P-95/002Fa

USEPA, 2002:Calculating Upper Confidence Limits for Exposure Point Concentrations at Hazardous Waste Sites. OSWER 9285.6-10, December.

USEPA, 2004: Risk Assessment Guidance for Superfund (Part E, Supplemental Guidance for Dermal Risk Assessment) Final. EPA/540/P/99/005.

#### Unit Intake Calculations

Ingestion Intake = (IR-GW x EF x ED)/(BW x AT)

Dermai Intake = (SA x EV x EF x ED)/(BW x AT)

#### Non-Mutagenic Chemicals

Cancer Ingestion Intake (Age 0 - 6) = 5.48E-06 Cancer Dermal Intake Time (Age 0 - 6) = 3.62E+01

Mutagenic Chemicals

Cancer Ingestion Intake (Age 0 - 2) = 1.83E-06 Cancer Dermal Intake (Age 0 - 2) = 1.21E+01

Cancer Ingestion Intake (Age 2 - 6) = 3.65E-06 Cancer Dermal Intake (Age 2 - 6) = 2.41E+01

Noncarcinogenic Chemicals

Noncancer Ingestion Intake = 6.39E-05 Noncancer Dermal Intake = 4.22E+02

Cancer risk from ingestion = Groundwater concentration x Cancer Ingestion Intake x Oral Cancer Slope Factor
Cancer risk from dermal contact = Groundwater concentration x Cancer Dermal Intake x DAevent x Dermal Cancer Siope Factor
Hazard Index from ingestion = Groundwater concentration x Noncancer Ingestion Intake / Oral Reference Dose
Hazard Index from dermal contact = Groundwater concentration x Noncancer Dermal Intake x DAevent / Dermal Reference Dose

#### TABLE 4.15.RME

### VALUES USED FOR DAILY INTAKE CALCULATIONS

# REASONABLE MAXIMUM EXPOSURE - CHILD RESIDENTS - INHALATION OF VOLATILES FROM GROUNDWATER FORMER DERECKTOR SHIPYARD, NAVSTA NEWPORT, NEWPORT, RHODE ISLAND

Scenario Timeframe: Current/Future

Medium: Groundwater Exposure Medium: Air

Exposure Route	Receptor Population	Receptor Age	Exposure Point	Parameter Code	Parameter Definition	Value	Units	Rationale/ Reference	Intake Equation/ Model Name
Inhalation	Residents	Child	Derecktor Shipyard	CA	Chemical concentration in air	Calculated	mg/m3	USEPA, 1991	Exposure Concentration (mg/m³) =

# TABLE 5.1 NON-CANCER TOXICITY DATA -- ORAL/DERMAL FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND PAGE 2 OF 2

#### Notes:

 U.S. EPA, 2004: Risk Assessment Guidance for Superfund (Part E, Supplemental Guidance for Dermal Risk Assessment) Interim. EPA/540/R/99/005.

- 2 Adjusted dermal RfD = Oral RfD x Oral Absorption Efficiency for Dermal.
- 3 Pyrene is used as a surrogate for benzo(g,h,i)perylene.
- 4 Values are for hexavalent chromium.
- 5 Adjusted IRIS value in accordance with IRIS.

## CANCER TOXICITY DATA -- ORAL/DERMAL FORMER ROBERT E. DERECKTOR SHIPYARD NAVSTA NEWPORT, NEWPORT, RHODE ISLAND PAGE 2 OF 2

#### Notes

- 1 USEPA, 2004: Risk Assessment Guidance for Superfund (Part E, Supplemental Guidance for Dermal Risk Assessment) Interim. EPA/540/R/99/005.
- 2 Adjusted cancer slope factor for dermal = Oral cancer slope factor / Oral absorption efficiency for dermal.
- 3 Trichloroethene, vinyl chloride, carcinogenic PAHs and hexavalent chromium are considered to act via the mutagenic mode of action. These chemicals are evaluated in accordance with USEPA's Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens (2005).
- 4 See text for a discussion of trichloroethene toxicity.
- 5 Values are for hexavalent chromium.

IRIS = Integrated Risk Information System.

1 - Mutagenic chemicals were evaluated in accordance with USEPA's Supplemental Guidance for Assessing Susceptibility from Early-Life Exposure to Carcinogens (2005).

## LIST OF TABLES RAGS PART D TABLE 9 - CENTRAL SHIPYARD SUMMARY OF RECEPTOR RISKS AND HAZARDS FOR COPCs

Table No.	
	Reasonable Maximum Exposures
9.1.RME	Current Adolescent Trespassers - Central Shipyard
9.2.RME	Current Adult Trespassers - Central Shipyard
9.3.RME	Current Lifelong Trespassers - Central Shipyard
9.4.RME	Current Industrial Workers - Central Shipyard
9.5.RME	Future Adolescent Trespassers - Central Shipyard
9.6.RME	Future Adult Trespassers - Central Shipyard
9.7.RME	Future Lifelong Trespassers - Central Shipyard
9.8.RME	Future Industrial Workers - Central Shipyard
9.9.RME	Current/Future Construction Workers - North Waterfront
9.10.RME	Hypothetical Child Residents - Central Shipyard
9.11.RME	Hypothetical Adult Residents - Central Shipyard
9.12.RME	Hypothetical Lifelong Residents - Central Shipyard

Mean of Detected131.9Mean of DetectedSD of Detected141.6SD of Detected	4.453 1.405
SD of Detected 141.6 SD of Detected Minimum Non-Detect 330 Minimum Non-Detect	5.799
Maximum Non-Detect 410 Maximum Non-Detect	6.016
Note: Data have multiple DLs - Use of KM Method is recommended  Number treated as Non-Detect	8
For all methods (except KM, DL/2, and ROS Methods),  Number treated as Detected	0
Observations < Largest ND are treated as NDs Single DL Non-Detect Percentage	100.00%
Warning: Data set has only 2 Distinct Detected Values.	
This may not be adequate enough to compute meaningful and reliable test statistics and estimates.	
The number of detected data may not be adequate enough to perform GOF tests, bootstrap, and ROS methods.  Those methods will return a 'N/A' value on your output display!  It is necessary to have 4 or more Distinct Values for bootstrap methods.	
However, results obtained using 4 to 9 distinct values may not be reliable.	
It is recommended to have 10 to 15 or more observations for accurate and meaningful results and estimates.
